Gearmotor and reducer

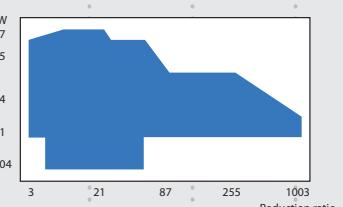

6W 40W 90W 0.1kW 0.2kW 2.2kW 3.7kW 5.5kW 30kW 55kW 132kW 1000kW

ALTAX® NEO

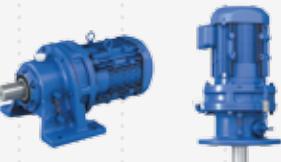

Small gearmotor which adopts the speed reducer of CYCLO® Drive.

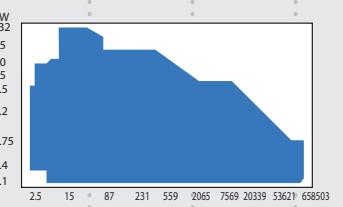

It can be designed freely in accordance with the purpose because the minimum coaxial flange dimensions in the industry and the mounting direction is free.

CYCLO® Drive

Synonymous with the drive with the delivery track record of 10 million units.

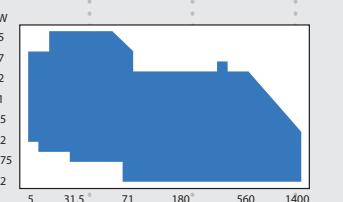

Compower® Planetary Gear Speed or Geared Motor

Compact in the diameter direction in spite of high torque.

The unique idea and mechanism greatly shortened the total length.

- Rated torque: 0.46 to 736kN·m

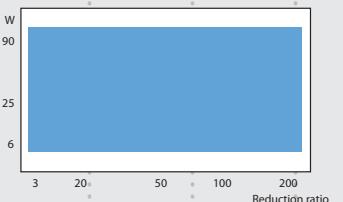

ASTERO® Gearmotor

The motor and gear head are isolated and easy-to-use.

You can choose combinations of abundant motor variations.

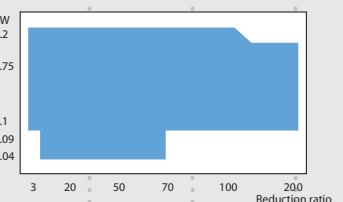

Prest® NEO Gearmotor

Compact, low-noise, large allowable load, etc.

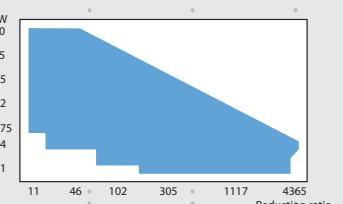

New parallel shaft gearmotor with ultimate ease-of-use.

Helical Buddybox® Drive

Parallel shaft gearmotor combining CYCLO® Drive and hollow shaft Helical Buddybox.

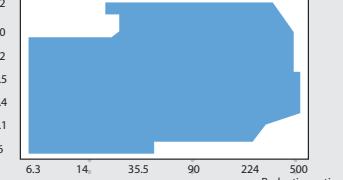

PARAMAX® Drive 9000 series

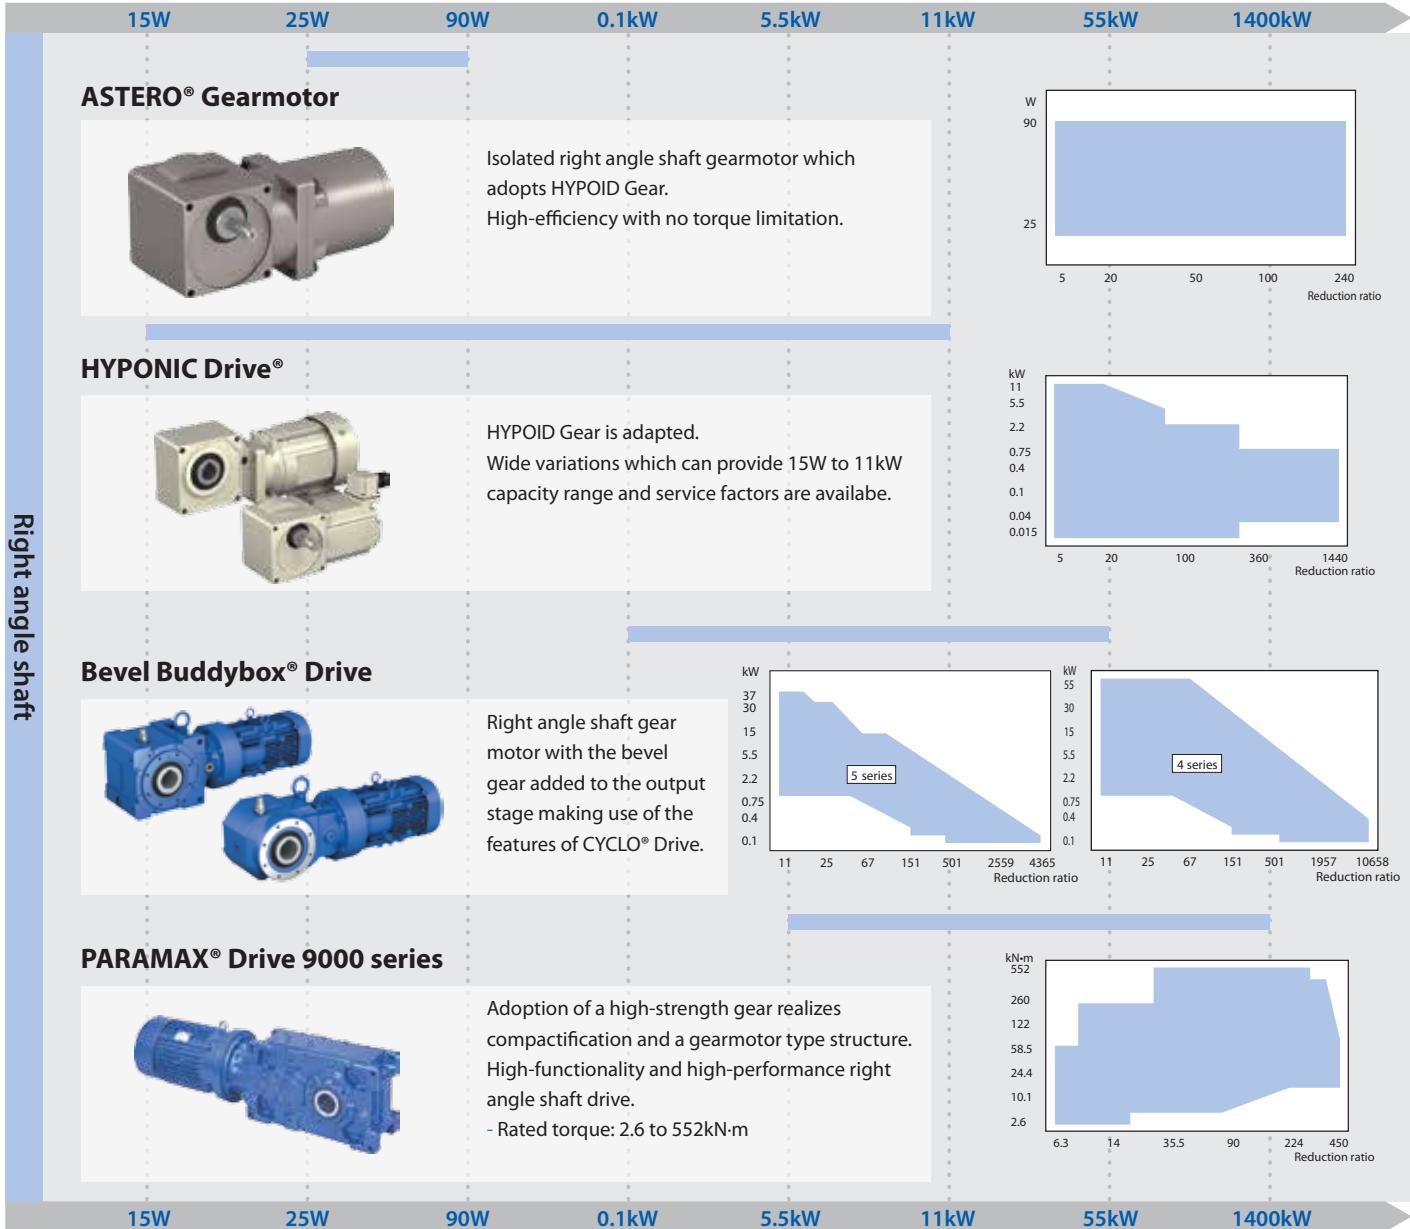

Compact adopting a high-strength gear. High-functionality and high-performance parallel shaft drive.

- Rated torque: 2.6 to 552kN·m

6W 40W 90W 0.1kW 0.2kW 2.2kW 3.7kW 5.5kW 30kW 55kW 132kW 1000kW

Inverter

Mechanical variator

Beier® Variator

Mechanical variator with the track record of tradition and trust of 50 years or longer for its high capacity and long life.
- Capacity: 0.2kW to 150kW

Warm drive

HEDCON® Worm Drive

High-performance Worm Drive which achieved high efficiency and high strength using unique double enveloping theory.
- Torque: 0.8 to 82kN·m

Precautions for the Premium Efficiency Motor

Commercial power source

The features of the premium-efficiency motor (top-runner motor) are different from a conventional standard efficiency motor. Especially, at the time of replacement from the existing product, it is necessary to review the power and peripheral equipment.

Motor characteristics

[Example]

Motor capacity 2.2kW
Power source voltage
200V 60Hz

Standard-efficiency motor

Motor speed:	1700r/min	Starting torque:	204%
Rated current:	8.90A	Stall torque:	229%
Starting current value:	46.9A		

Premium-efficiency motor

Motor speed:	1740r/min	Starting torque:	297%
Rated current:	9.32A	Stall torque:	402%
Starting current value:	74.9A		

The premium-efficiency motor:

- reduces the occurrence loss so its speed is faster than that of the former standard-efficiency motor.
For purposes for which the operation speed cannot be raised, it is necessary to reconsider the reduction ratio associated with an increase in the motor speed.
- If the load torque becomes equivalent or larger than that of the standard-efficiency motor due to an increase in the speed, the motor output will also increase.
Depending on the load conditions, the power consumption may increase more than that of the standard-efficiency motor.
- To reduce copper loss, the winding resistance of the motor is lowered and the starting current, starting torque, and stall torque (maximum torque) is higher than those of the standard-efficiency motor.
- In some cases, it may be necessary to change peripheral equipment such as the circuit breaker

Starting and stopping frequency and load coefficient of the drive

Standard-efficiency motor

Starting and stopping frequency (times/hour)	Less than 10 hours a day			Less than 24 hours a day		
	I	II	III	I	II	III
10 or less	1.00	1.15	1.50	1.20	1.30	1.65
200 or less	1.10	1.35	1.65	1.30	1.50	1.85
500 or less	1.15	1.50	1.80	1.40	1.65	2.00

Premium-efficiency motor

Starting and stopping frequency (times/hour)	Less than 10 hours a day			Less than 24 hours a day		
	I	II	III	I	II	III
1 or less	1.00	1.15	1.50	1.20	1.30	1.65
3 or less	1.00	1.25	1.60	1.20	1.40	1.70
10 or less	1.00	1.35	1.70	1.20	1.50	1.80
60 or less	1.00	1.45	1.75	1.25	1.65	2.00

- Since the starting torque and stall torque (maximum torque) of the premium-efficiency motor are large, the selection procedure, start and stall frequencies, and drive load coefficient are different from those of a standard-efficiency motor. (For details see B10)

Inverter drive

Though it can be used in the same way as a standard-efficiency motor, the parameters (rated current,etc) of the inverter duty motor are different.

If the existing product is replaced with a premium-efficiency motor and the existing inverter continues to be used, the parameters of the inverter must be changed.

Electronic thermal relay setting

- Since the rated current is higher than that of the standard-efficiency motor, it is necessary to change the setpoint of the electronic thermal relay.

During V/F control and fixed torque boost operation

- With the setpoint torque boost for the standard-efficiency motor, the current flow may be excessive during slow speed operation. If the current flow is too much, reduce the setpoint value.

During sensorless control operation

- After replacing the gearmotor, perform auto-tuning.

Motor brakes

The characteristics of the brake of the premium-efficiency motor differ from those of the conventional standard-efficiency motor and AF motor for inverter. For example, the operation delay time at the time of braking, and the standard brake torque are different.

The braking stop position may be misaligned, particularly in the case of replacement of the existing product. It may be necessary to review the braking circuit and the control signal timing of braking in the inverter-drive.

[Example] Motor capacity 2.2kW

Brake characteristics	Standard-efficiency motor		Premium-efficiency motor	
	3-phase motor	AF Motor for Inverter	Premium-Efficiency, 3-phase motor	Premium-Efficiency, 3-phase motor for inverter
Brake type	FB-3D	FB-5B	FB-3E	
Brake torque (N·m)	22	37	22	
at the time of braking (sec)	Normal braking circuit (Simultaneous turn-off circuit) 0.3 - 0.4	-	0.75 - 0.95	-
	Normal braking circuit(inverter separate turn-off circuit) 0.15 - 0.2	0.2 - 0.25	0.4 - 0.5	
	Quick-braking circuit 0.01 - 0.02	0.01 - 0.02	0.02 - 0.04	

Compliance with International Standards

The standards of the motor vary according to the country and region.

The characteristics standards and safety standards of the motor vary according to the country and region so when using a motor outside Japan, the motor has to be compliant with the standards of the corresponding country and region.

The efficiency regulation is enforced in each country.

For the prevention of global warming, we are required to reduce the use of energy, which is a source of CO₂ emissions, and efficiency regulations are enforced in various countries to encourage propagation of high-efficiency motors.

Notes

COMMON

Selection Procedure

(Example for BBB-H series)

COMMON

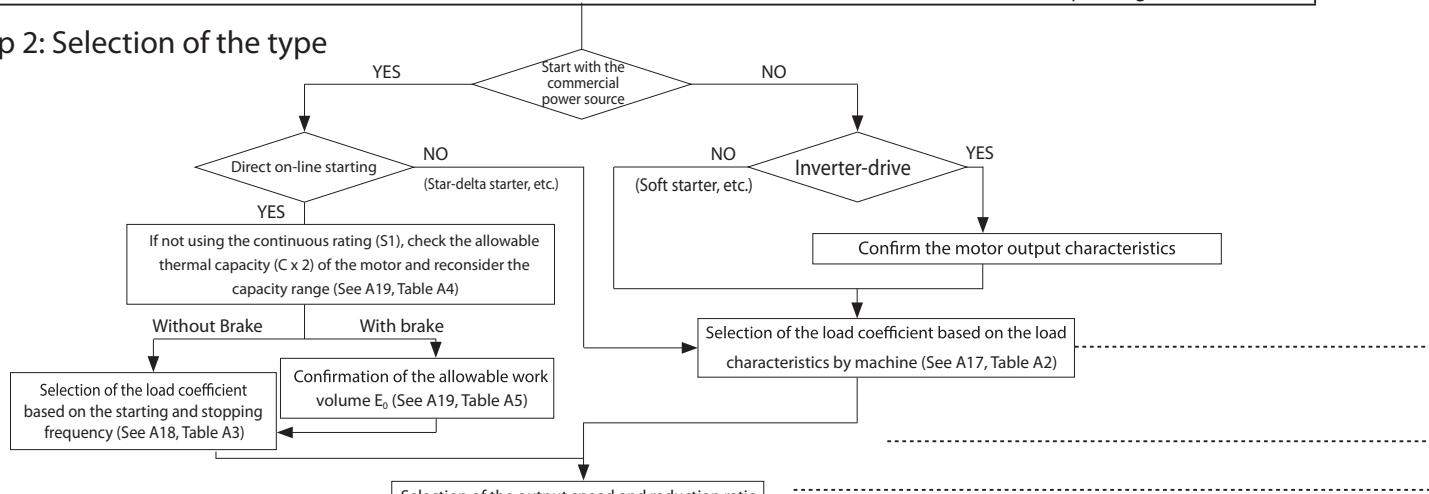

Select the type referring to the flow chart. If you are not sure of the selection method, please consult us.

Step1: Determination of the operation conditions

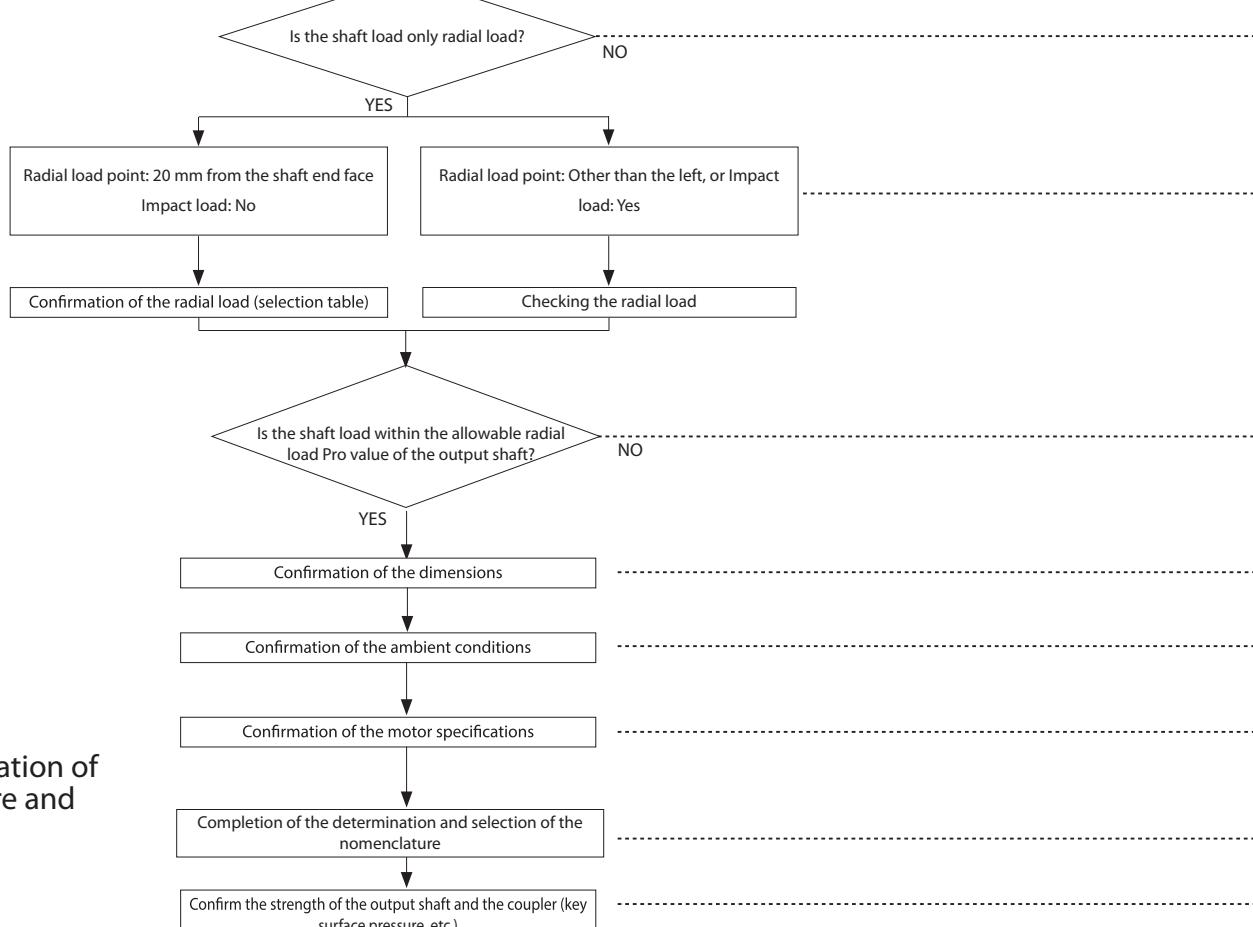

Before starting selection, determine the following conditions:

- Purpose
- Whether the product is operated continuously or started and stopped frequently
- Whether the power source is directly input, star delta starting or inverter driven
- Motor capacity (kW) and output speed or reduction ratio
- Radial load
- Operation time per day
- Degree of the impact load
- Mounting direction (output shaft direction)
- Specifications related to motors (power source frequency, voltage, existence of brake, etc.)
- Ambient conditions (operating environment)

Step 2: Selection of the type

Step3: Confirmation

Step4: Determination of the nomenclature and completion

Selection Procedure

COMMON

Descriptions of terms
<ul style="list-style-type: none">- Service factor (SF) Value calculated by dividing the allowable input capacity of the drive by the motor capacity.- Operating environment package Package created to enable to determine the specifications just by selecting the levels to prevent three environmental elements (water, corrosion and powder dust) (See B7).

Description of the procedure
<ul style="list-style-type: none">- Select the load coefficient suitable for your purpose from A17.
<ul style="list-style-type: none">- For operation to repeat starting and stopping, confirm the starting and stopping frequency and load coefficient of the drive of A17, and the allowable heat capacity of the motor of A19. Also confirm that with flange, the braking work volume is equivalent to or less than the allowable work volume E_0 in A19.
<ul style="list-style-type: none">- Confirm the brake torque in K4.
<ul style="list-style-type: none">- Open the page where your motor capacity is described in the selection table from B2.
<ul style="list-style-type: none">- Select the column where the values closest to the output speed or reduction ratio in use is described in the selection table.
<ul style="list-style-type: none">- Confirm that the output torque meets your usage value. If the output torque is insufficient, use a one-class larger motor capacity.
<ul style="list-style-type: none">- Select a combination with a larger service factor (SF) than the selected load coefficient from the selection table.
<ul style="list-style-type: none">- Confirm whether the radial load is the only load applied to the slow speed shaft of the drive.
<ul style="list-style-type: none">- Consult us.
<ul style="list-style-type: none">- Please use the Bevel Buddybox series 4.
<ul style="list-style-type: none">- Confirm that the selected combination is compatible with the direction, mounting style, and lubrication method of your slow speed shaft.
<ul style="list-style-type: none">- Confirm the dimensions. If it is not compatible with your operating conditions, please consult us.
<ul style="list-style-type: none">- Confirm with "Standard specifications" that the selected combination is compatible with the conditions such as the surrounding environment. Also specify "Operating environment package".
<ul style="list-style-type: none">- Confirm that the motor directly connected to the selected type is compatible with your operating conditions (power source, environment, thermal class, etc.).
<ul style="list-style-type: none">- For the selected type, determination of the nomenclature referring to "Nomenclature" in A12. The type selection is completed.
<ul style="list-style-type: none">- Confirm with the maximum torque at starting and stopping.

Selection Example

(Example for BBB-H series)

Select the type using an example according to the selection procedure on A14.

Load Coefficient

The Bevel Buddybox Drive H series is designed for operating conditions of uniform load and 10 hours per day of use.

The following load coefficient must be anticipated in cases where daily machine use exceeds 10 hours per day, or depending on the load conditions of the machine in use.

The selection methods of the load coefficient are divided into (1) or (2) below:

(1) Selection based on the load characteristics by machine

[Classification of the load coefficient] U: Uniform load M: Light impact H: Heavy impact

Table A1 - Load coefficient of the drive

Operation time	Up to 10 hours/day			Up to 24 hours/day		
	U	M	H	U	M	H
Load coefficient	1.00	1.25	1.75	1.25	1.50	2.00

Note) The load coefficient is different to that of the Bevel Buddybox 4 series and 5 series.

For machines with * symbol or not described in the table, please consult us.

Note) Since the names and machine characteristics in this table may differ from those of the machine to be used, please use the values in this table as a reference only.

Load Coefficient

COMMON

(2) Selection based on the starting and stopping frequency

If the machine is starting and stopping frequently during operation, select the product based on the starting and stopping frequency and the load coefficient of the drive (Table A3). At the same time, confirm the allowable heat capacity of the motor as shown in Table A4. Further, calculate the braking workload for brakemotors by reference page C27. Confirm that it is equal to or less than the allowable workload E_0 described in Table A5. (Also confirm it for emergency stopping)

Table A3 - Starting and stopping frequency and load coefficient of the drive

Premium-efficiency, 3-phase motor

Starting and stopping frequency (times/hour)	Less than 10 hours a day			Less than 24 hours a day		
	I	II	III	I	II	III
1 or less	1.00	1.15	1.50	1.20	1.30	1.65
3 or less	1.00	1.25	1.60	1.20	1.40	1.70
10 or less	1.00	1.35	1.70	1.20	1.50	1.80
60 or less	1.00	1.45	1.75	1.25	1.65	2.00

$$\text{Inertia moment (GD}^2\text{) ratio} = \frac{\text{Inertia moment of the load converted to the motor shaft}}{\text{Inertia moment of the motor (GD}^2\text{) of the motor}}$$

Classification of the load coefficient

I: Allowable inertia moment (GD²) ratio =< 0.3

II: Allowable inertia moment (GD²) ratio =< 3

III: Allowable inertia moment (GD²) ratio =< 10

- Notes)
1. The load coefficient is different to that of the Bevel Buddybox 4 series and 5 series.
 2. Include the number of times that braking by brake, clutch etc. occur in the starting/stopping count.
 3. If the machine is started under torque and radial loads, please consult us because it may be necessary to consider other options.
 4. If the ratio of the starting and stopping frequency to the inertia moment (GD²) exceeds the above-mentioned value, please consult us.

Precautions

- With premium efficiency 3-phase motors, since the starting torque and stall torque (maximum torque) are large, selection procedures, starting and stopping frequencies, and the load coefficient of the drive are different from conventional motors.

Load Coefficient

COMMON

Table A4 - Allowable heat capacity of the motor ($C \times Z$)

kW x 4P	Allowable $C \times Z$				Moment of inertia of the motor $\text{kg}\cdot\text{m}^2$		Motor GD^2 $\text{kgf} \cdot \text{m}^2$	
	(35%ED or less)	(Over 35%ED to 50%ED or less)	(Over 50%ED to 80%ED or less)	(Over 80%ED to 100%ED or less)	Standard	With brake	Standard	With brake
Premium-efficiency, 3-phase motor	2.2	1000	900	400	200	0.00880	0.00978	0.0352 0.0391
	3.0	1000	900	400	200	0.0100	0.0110	0.0400 0.0440
	3.7	800	800	800	700	0.0194	0.0209	0.0777 0.0835
	5.5	300	300	200	150	0.0291	0.0306	0.116 0.122
	7.5	400	350	300	300	0.0409	0.0450	0.164 0.180
	11	200	200	150	150	0.0561	0.0602	0.224 0.241

Check that $C \times Z$ calculated in (1) through (3) below is within the allowable CZ in the motor capacity-%ED corresponding to Table B4.

(1) You can calculate C from the following equation.

$$[SI \text{ unit}] \quad C = \frac{J_M + J_L}{J_M}$$

$$[\text{Gravity unit}] \quad C = \frac{GD_M^2 + GD_L^2}{GD_M^2}$$

J_M : Moment of inertia of the motor ($\text{kg}\cdot\text{m}^2$)

GD_M^2 ; Motor GD^2 ($\text{kgf}\cdot\text{m}^2$)

J_L : Motor axis conversion, Total moments of inertia excluding the motor ($\text{kg}\cdot\text{m}^2$)

GD_L^2 ; Motor axis conversion, total GD excluding the motor ($\text{kgf}\cdot\text{m}^2$)

(2) Calculate the number of times starting occurs per hour (times/hr).

(A) Assuming, of one cycle, the operation time to be t_a (s) and the pause time to be t_b (s), when starting n_r (times/cycle) during this period

$$Z_r = \frac{3600n_r}{t_a + t_b} \text{ (times/hr)}$$

(B) Further, when including the number of times of inching n_i (times/cycle) during 1 cycle (t_a+t_b), this is converted to the number of times of starting, in which it is converted to the number of times of inching per hour Z_i .

$$Z_i = \frac{3600n_i}{t_a + t_b} \text{ (times/hr)}$$

(c) Calculate the number of times of starting per hour Z (times/hr) from (a) and (b).

$$Z = Z_r + \frac{1}{2}Z_i = \frac{3600}{t_a + t_b} \cdot \left(n_r + \frac{1}{2}n_i\right) \text{ (times/hr)}$$

(3) Calculate $C \times Z$.

Calculate the product of C calculated in (1) and Z calculated in (2): $C \times Z$.

(4) Load time rate %ED

$$\%ED = \frac{t_a}{t_a + t_b} \times 100$$

Table A5 - Allowable work volume of the motor brake E_0

Unit: E_0 (J/min)

Brake type	FB-3E FB-4E	FB-5E FB-8E	FB-10E FB-15E
Allowable work volume E_0	5720	6900	10800

11kW	B6

About the suffix and possibility to manufacture the motor

- Empty : The 3-phase motor is 0.1 to 0.55kW
- EP : The premium-efficiency, 3-phase motor can be manufactured in combination with any frame sized of 0.75kW or higher.
- AV : AF Motor for Inverter
- AP : Premium-efficiency, 3-phase motor for inverter
- ES : High-efficiency 3-phase motor
For these motors, confirm the columns of the possibility of manufacturing.

Legend

- Can be manufactured as a standard product.
- △ Can be manufactured but the specifications have to be confirmed, so please consult us.
- Please consult us.
- Cannot be manufactured.

HYPONIC® Drive**Gearmotor****Dimension Drawing**

	Page
Frame Size #1310 - #1522 (0.75kW ~ 5.5kW)	C2
Frame Size #1530 - #1640 (0.75kW ~ 5.5kW)	C4
Frame Size #1634 (5.5kW ~ 11kW)	C6
Detailed Dimension	C7

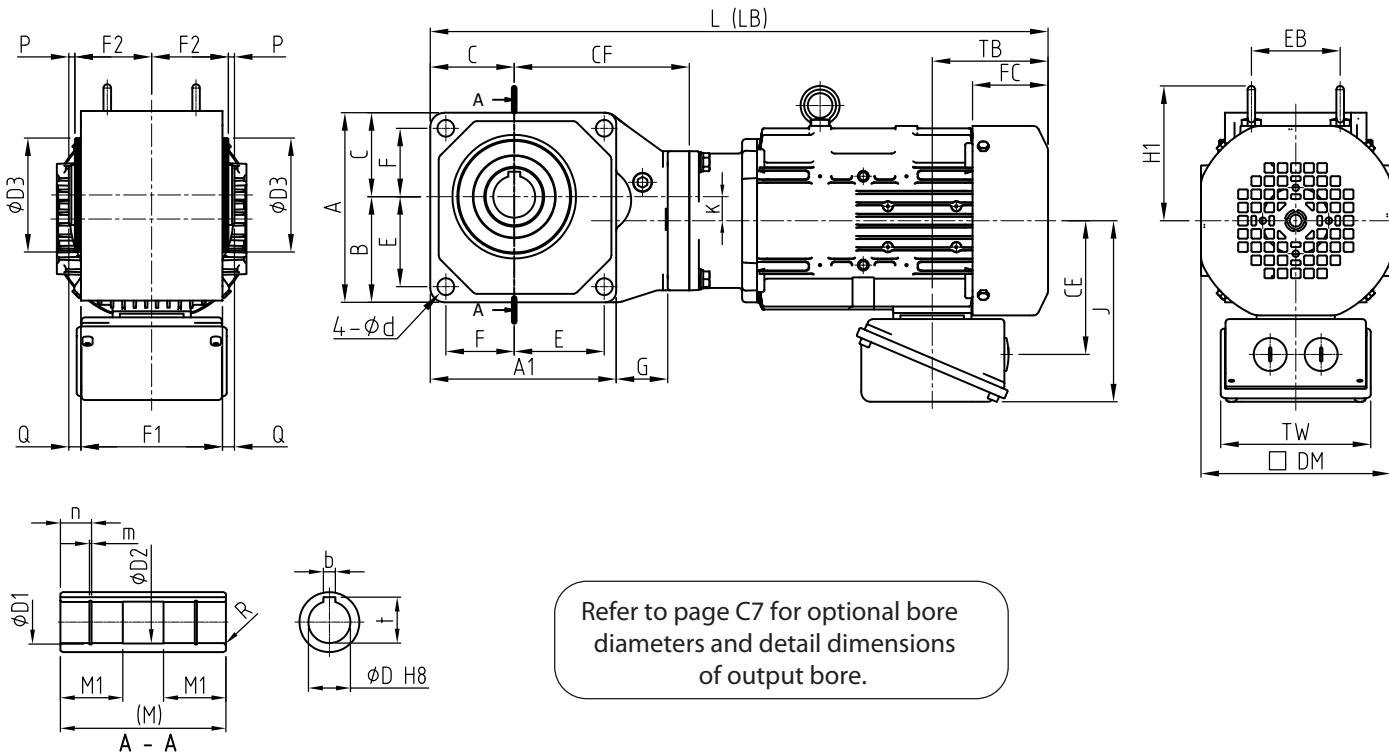

Precautions

1. The dimension values described in this catalog dimension drawing are the maximum dimensions considering the asperities of each part excluding the shaft diameter and major installation parts. Therefore, they may be a little different from the actual product dimensions.
2. For the dimensions of the parts not described in the dimension drawing, please consult us.
3. This catalog dimension drawing may be changed without notice to customers.
4. For the dimensions of your product, please confirm the manufacturing specification which we will provide.

Dimension Drawing

Rotation Directions

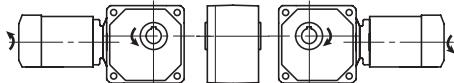

Hyponic with Premium Efficiency (IE3) Motors

Motor shaft will be rotating counterclockwise looking from the fan cover side when wire is connected as shown in connection figures in page G16 -G19.

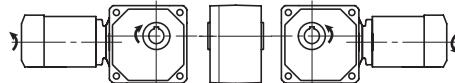

The direction of the output shaft rotation is shown in the arrows of below diagrams.

Frame size	Reduction ratio	Frame size	Reduction ratio

Mounting and Torque Arm

Mounting on driven shaft

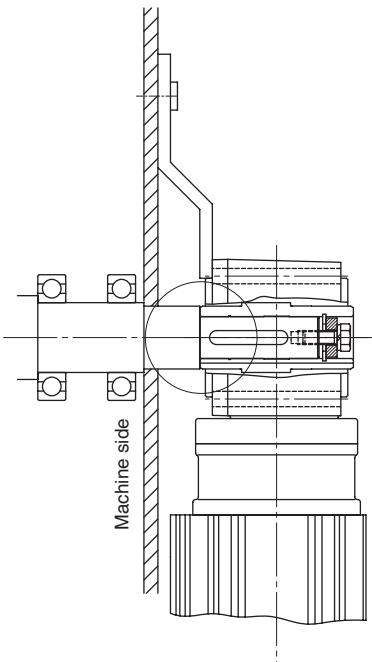

- Apply molybdenum disulfide to the surface of the driven shaft and the inside of the hollow shaft, and insert Hyponic Drive onto the driven shaft.
- When engagement is too tight, lightly strike on the end of the hollow output shaft with a mallet. Never strike on the casing. It is recommended to make a jig shown on the right for smooth insertion.
- The hollow shaft dimension tolerance is in accordance with JIS "H8". The recommended tolerance for the driven shaft is :
 - uniform load without impact.....JIS h6 or js6
 - shock load or large radial load.....JIS js6 or k6
- Snap ring size is in accordance with JIS B2804C.

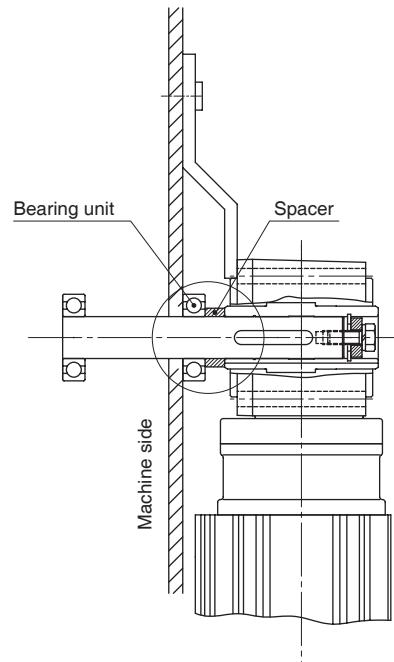

aRetaining ring	dNut
bSpacer	eDouble-end threaded bolt
cThrust bearing	

Hyponic Drive must be secured to driven shaft

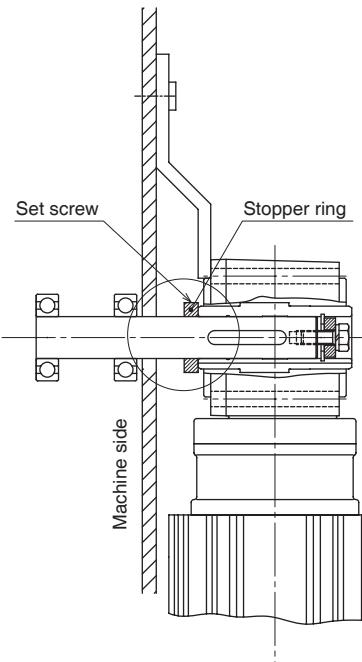

- a) How to secure Hyponic Drive not to move to the machine side (See below Figs)

Secured by staged shaft

Secured by spacer
(stageless driven shaft)

Secured by a set screw and a
stopper (stageless driven shaft)

Mounting and Torque Arm

b) Mounting the Hyponic Drive on the machine (Figs. 1 - 3)

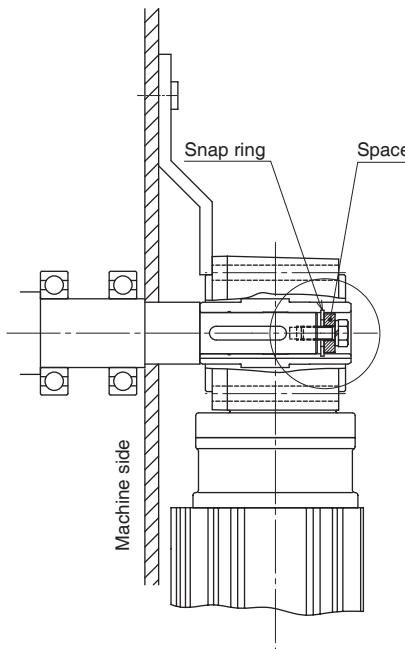

Fig. 1 secured by a spacer and a snap ring

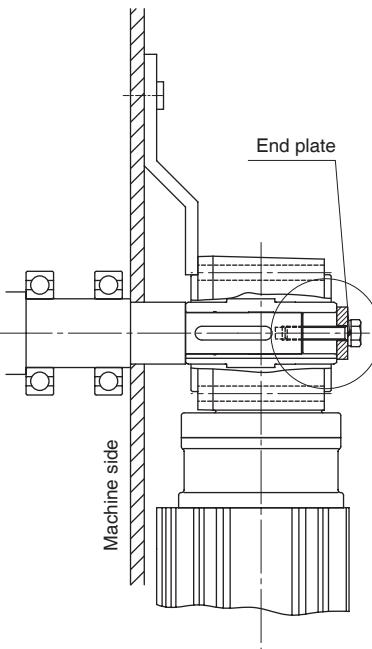

Fig. 2 secured by an end plate

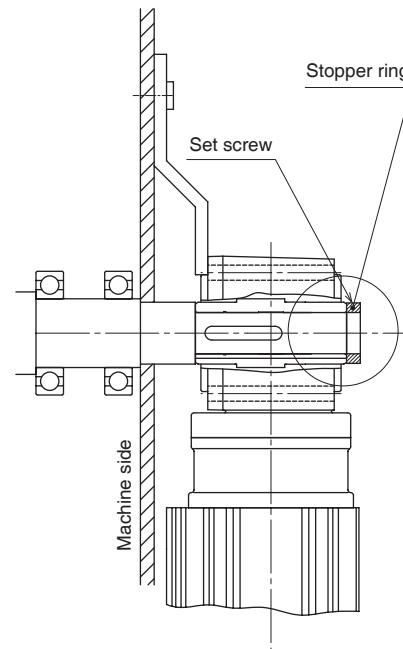

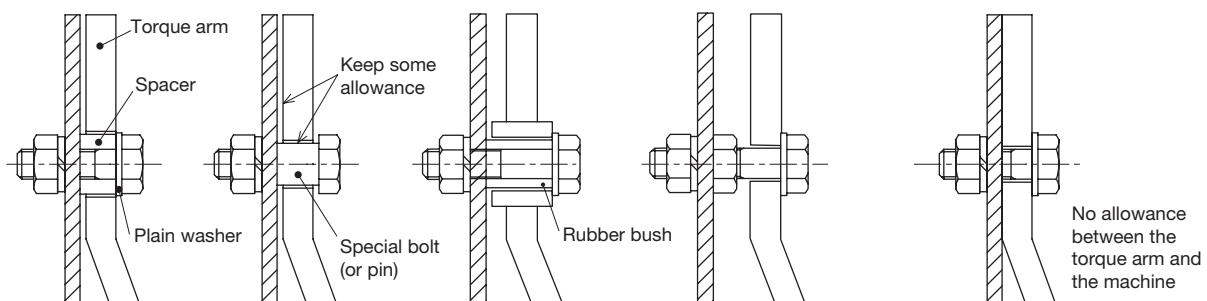

Fig. 3 secured by a set screw and a stopper ring

Torque Arm whirl stop

Attach the torque arm to Hyponic Drive casing on the machine side with hex socket head cap screws. (Refer to the table below for sizes of the bolts.).

Leave some allowance in the section of torque arm whirl stop so that excessive force will not be applied between Hyponic Drive and the driven shaft. Don't secure the torque arm with the whirl stop bolt. Or it may damage the whirl stop bolt, the torque arm, Hyponic Drive, or the machine.

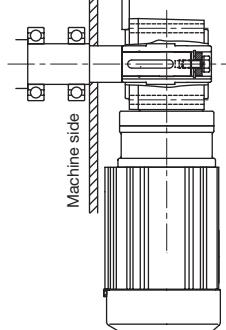

In case of frequent start/stop operations, or repeated normal/reverse operations, use a rubber bush between the torque arm and mounting bolt (or spacer) to absorb the shock.

(Adjust the allowance according to
the movement of the machine)
Good

(Excessive force on the whirl stop bolt,
machine, and Hyponic Drive may
cause damage)
Not recommended

Example of whirl stop mounting (Section A)

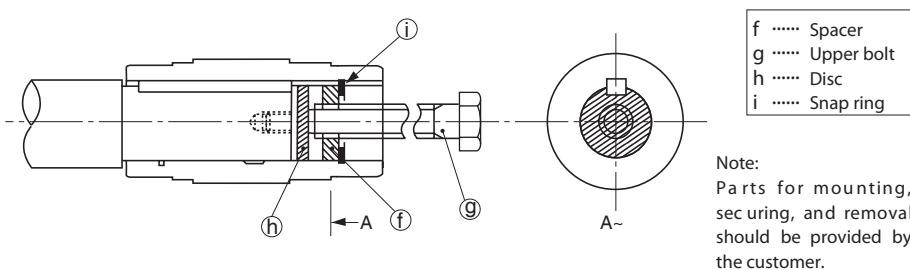

Frame size	Bolt
1310, 1320	M10
1410, 1420, 1510, 1520, 1521, 1522, 1634	M12
1530, 1531	M16
1630, 1631, 1632, 1633, 1640	M20

Mounting and Torque Arm

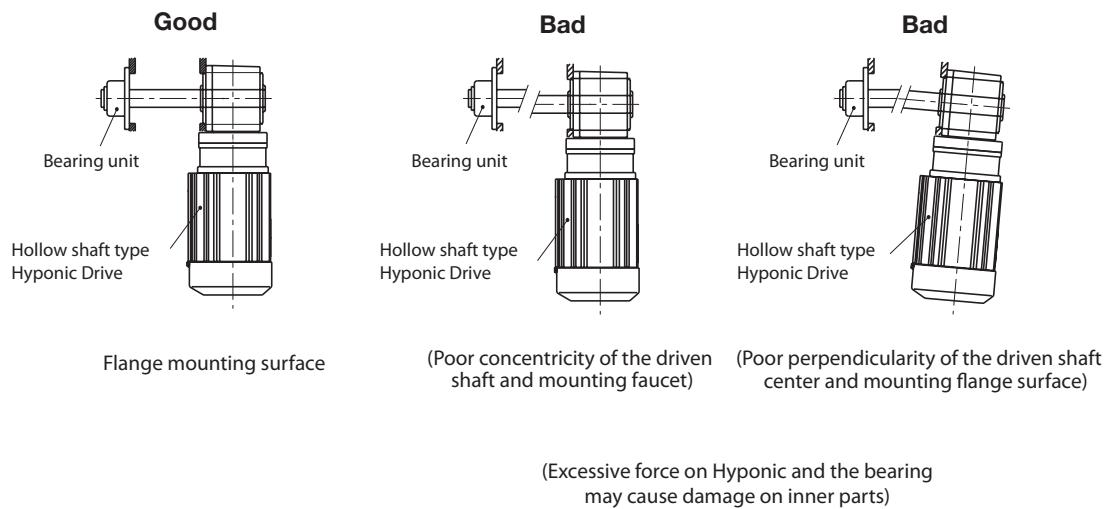

Removal from a driven shaft

Handle with care so that excessive force will not be applied between the casing and the hollow shaft. It is recommended to make a jig as shown on the right, for easy removal

Flange mounting and casing bottom mounting (optional)

Handle with care in order not to apply excessive force to driven shaft or hollow shaft by twisting the Hyponic casing.

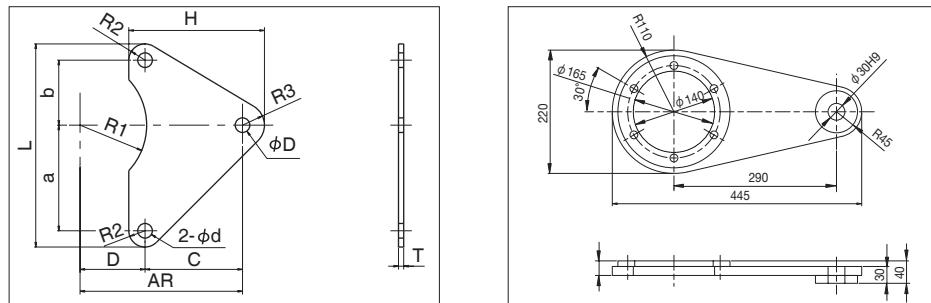

Mounting and Torque Arm

Torque Arm Designs

- Refer to this page for standard torque arm designs, used for continuous operations or infrequent start/stop.
- Refer to page D8 and D9 when designing torque arm on your own, or when start/stop is frequent.
- Mount torque arm to reducer casing using 4 bolts.

Standard Torque Arm designs

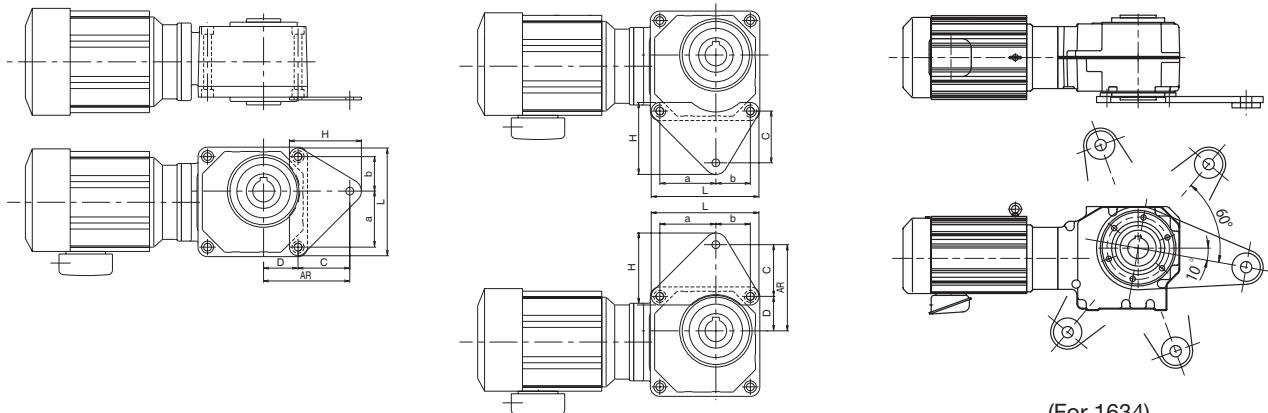

(For 1634)

Assembly Examples

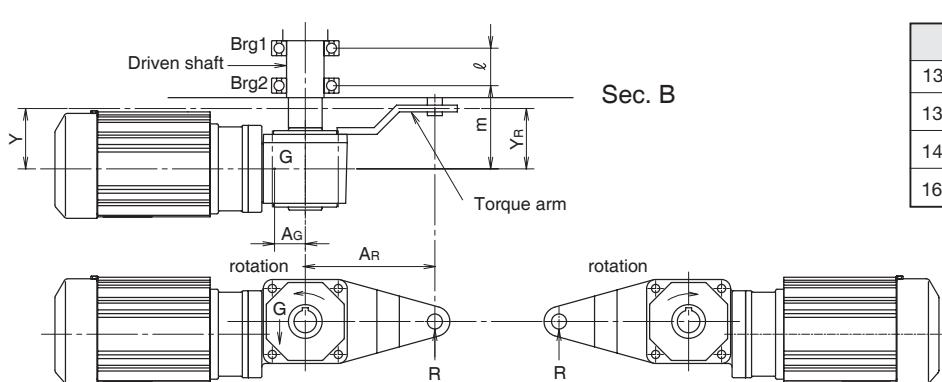

Notes:

- Use torque arm only for whirl stop function.
- Fasten reducer at driven shaft for fixing in axial direction.

Mounting and Torque Arm

Check the strength of Torque Arm and driven shaft and the lifetime of the bearing

Frame size	A _G (m)
1310	0.15
1320, 1410, 1510	0.2
1420, 1520, 1530, 1531, 1640	0.25
1630, 1631, 1632, 1633	0.30

approximate values

1. Torque arm load : $R = \frac{T+A_G \cdot G}{A_R}$

2. Brg.1 load : $B1 = \frac{m(R-G)-Y_R \cdot R}{R}$

3. Brg.2 load : $B2 = \frac{(R+m)(R-G)-Y_R \cdot R}{R}$

4. Sec. B of driven shaft

: $M=Y_R \cdot R - Y(R-G) \quad 0 < Y \leq m$

T : Output torque [N·m]

G : Hyponic Drive gravity [N]

R : Torque arm load [N]

A^G : Distance between the centers of the driven shaft and gravity [m]

A^R : Distance from driven shaft center to torque arm whirl stop [m]

Y^R : Distance from the center of Hyponic Drive to torque arm whirl stop [m]

m : Distance from the center of Hyponic Drive to Brg.2 [m]

R : Distance between Brg.1 and Brg.2 [m]

Y : Distance between the center of Hyponic Drive and Sec. B [m]

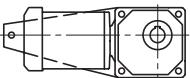

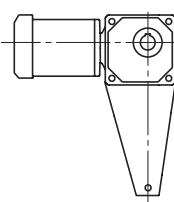

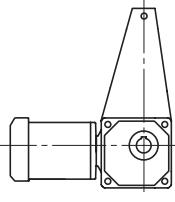

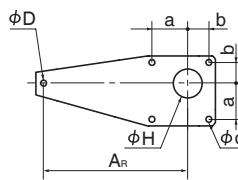

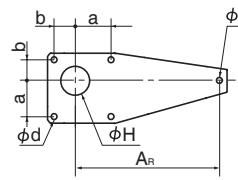

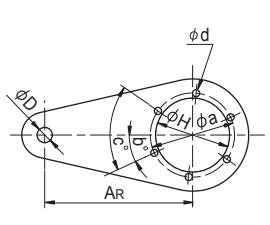

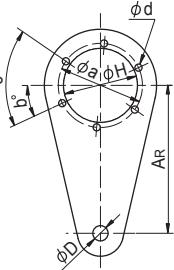

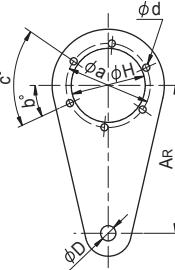

Note: Output torque is (+) on the shown rotation, and (-) on the opposite rotation.

Selection Table

GEARMOTOR
SELECTION

	Page
0.75kW	E2
1.5kW	E2
2.2kW	E3

About the suffix and possibility to manufacture the motor

- EP : The premium-efficiency, 3-phase motor can be manufactured in combination with any frame sized of 0.75kW or higher.

Legend

- Can be manufactured as a standard product.
- △ Can be manufactured but the specifications have to be confirmed, so please consult us.
- Please consult us.
- Cannot be manufactured.

Precautions

1. The dimension values described in this catalog dimension drawing are the maximum dimensions considering the asperities of each part excluding the shaft diameter and major installation parts. Therefore, they may be a little different from the actual product dimensions.
2. For the dimensions of the parts not described in the dimension drawing, please consult us.
3. This catalog dimension drawing may be changed without notice to customers.
4. For the dimensions of your product, please confirm the manufacturing specification which we will provide.

Dimension Drawing

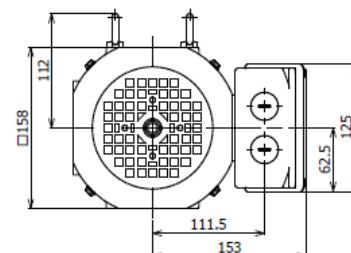

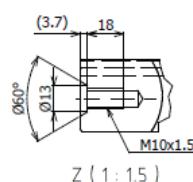

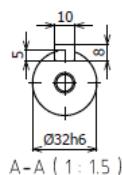

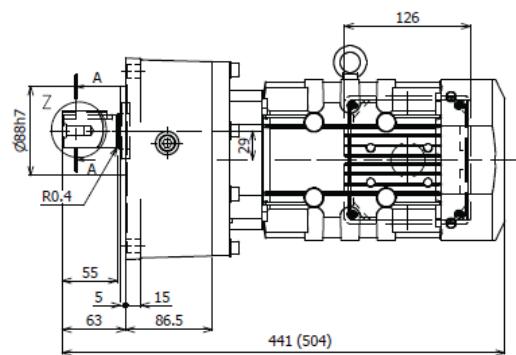

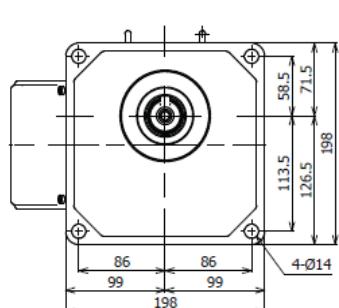

- Note)
1. Output shaft diameter: Dimension tolerance compliant with the JIS B 0401-1998 "h6."
 2. Shaft end key dimensions: Dimension tolerance compliant with the JIS B 1301-1996 "Parallel Keys."
 3. For the detailed dimensions of the output shaft section, see Page C7.
 4. The dimensions and masses in the dimensions drawings are subject to change without prior notice.
 5. Values in parentheses indicate the type, dimensions and mass of the motor with brake.

Allowable Thrust Load / Moment of Inertia GD²

■ Output Shaft Allowable Thrust Load

$$\left(\frac{Pr \cdot Lf}{Pro} + \frac{Pa}{Pao} \right) \cdot Cf \cdot Fs \leq 1$$

Select each value to ensure the following formula:

- Pr : Actual radial load
- Pro : Allowable radial load (see a selection table)
- Pa : Actual thrust load
- Pao : Allowable thrust load
- Lf : Load location factor
- Cf : Coupling factor
- Fs : Shock factor

Table G1 Output Shaft Allowable Thrust Loads

Notes: 1. The keyway dimensions comply with the JIS B 1301-1996 Parallel Keyways (Ordinary).

2. The information in this table is subject to change without prior notice.

■ Standard Rust-Proof Specifications

Prior to shipment, our finished products are provided with rust-proof treatment based on the following standards:

(1) External rust-proof treatment

Rust proof oil is applied prior to shipment. After shipment, check a rust-proof condition half annually and apply the oil again if necessary

(2) Internal rust-proof treatment

Rust-proof period	1 year
Storage condition	To be stored inside a general factory building or warehouse free of humidity, dust, drastic temperature change, and corrosive gases.

About the suffix and possibility to manufacture the motor

- EP : The premium-efficiency, 3-phase motor can be manufactured in combination with any frame sized of 0.75kW or higher.

Legend

- Can be manufactured as a standard product.
- △ Can be manufactured but the specifications have to be confirmed, so please consult us.
- Please consult us.
- Cannot be manufactured.
- ◊ Suffix and Mounting Positions, please refer to Nomenclature pages A34 ~ 35

Selection Table

Precautions

1. The dimension values described in this catalog dimension drawing are the maximum dimensions considering the asperities of each part excluding the shaft diameter and major installation parts. Therefore, they may be a little different from the actual product dimensions.
2. For the dimensions of the parts not described in the dimension drawing, please consult us.
3. This catalog dimension drawing may be changed without notice to customers.
4. For the dimensions of your product, please confirm the manufacturing specification which we will provide.

7	Pinion shaft	14	Fan		

How to Read Nameplates

■ Gearmotor (Motor directly connected)

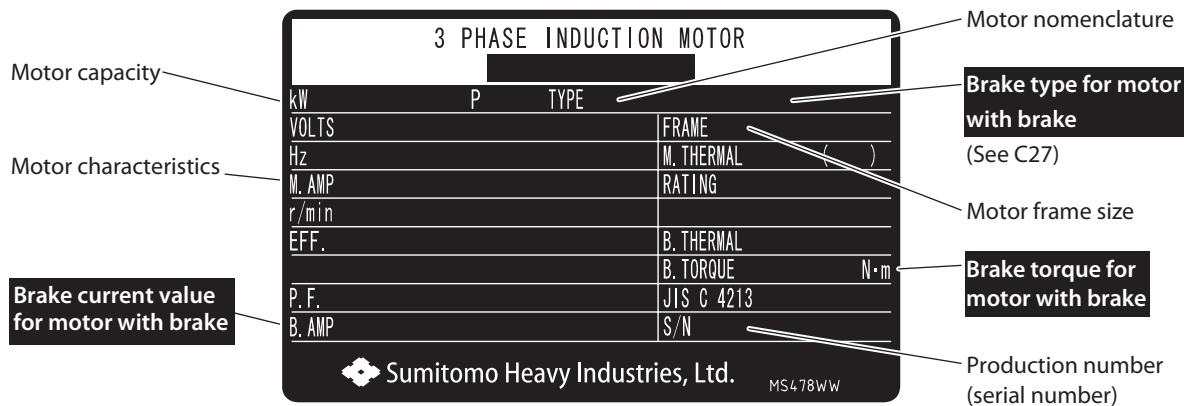

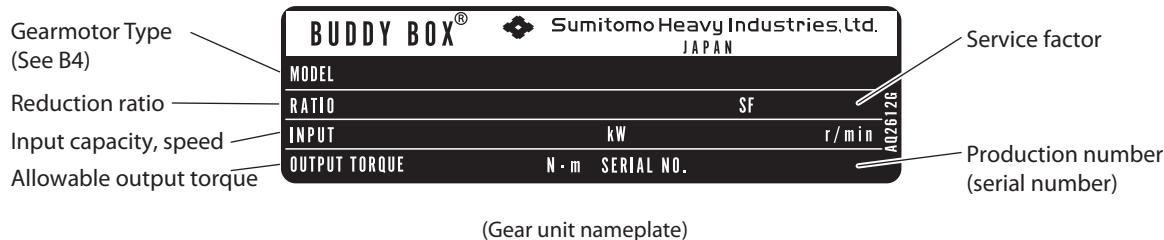

Figure C2 Gear unit nameplate

Lubrication

■ Standard Lubrication

- The gear part is filled with long-life grease, so long-term use is possible without replenishment. However, an even longer product life can be achieved by carrying out an overhaul at roughly 20,000 hours or 3 to 5 years.
- Overhauling of the gearmotor requires skill, so always carry it out at one of our authorized service stations.

■ Precautions for Oil Seal

- Oil seals have a service life, so the sealing effect may decrease over time due to natural deterioration and wear. The service life length will vary widely depending on the drive operating conditions and the surrounding environment. Given normal operation, (uniform load, running 10 hours per day, normal temperature) as a guideline it is recommended to change them every 1 to 3 years. Meanwhile, if rust is developing on the shaft (or collar) at that time, please have it replaced at the same time.
- Lubricating grease is applied to the oil seal. Oil from the grease described above may seep out during the early stages of operation. If oil seeps out, please wipe it off. If oil continues to seep out, replacement of the oil seal is recommended.

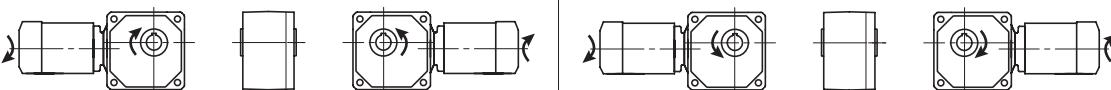

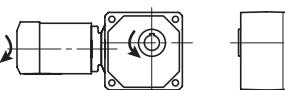

Output Shaft Rotational Direction and Bore Diameter

■ Output Shaft Rotational Direction

The motor shaft rotates to the right when viewed from the fan cover side, if connections are carried out according to the connection diagrams (during forward running) on pages C34 to C41.

The output shaft rotational direction at this time will be as follows.

Table J2 Output shaft rotational direction

Frame size	Reduction ratio	
HZ522	5, 7, 10, 12, 15, 20	-
HZ523	5, 7, 10, 12, 15	-
HZ524	5, 7, 10	-
HA635	5, 7, 10, 12, 15	20
Rotation direction		

Note) For reverse rotation, swap the Rs and Ts on pages C34 and C36-C39.

■ Output Shaft Bore Diameter

The output shaft bore diameter can be made to an optional dimension, other than the standard dimension.

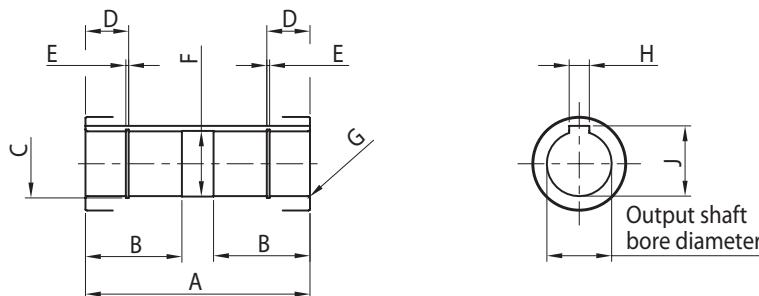

Figure J4 Output shaft bore diameter

Table J3 Output shaft bore diameter

Frame size	Output shaft bore diameter	A	B	C	D	E	F	G	H	J
HZ522, HZ523, HZ524	Ø 40 (Optional)	156	60	Ø 42.5	30	1.95	Ø 40.6	R1.5	12	43.3

■ Attaching the Output Shaft (Hollow Shaft)

1. Attachment to the driven shaft

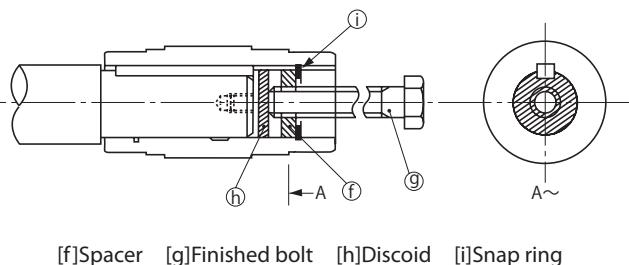

- Apply molybdenum disulfide grease to the surface of the driven shaft and the inner diameter of the output shaft (hollow shaft), and insert the drive into the driven shaft.
- If the fitting is tight, insert by lightly hitting the end face of the output shaft (hollow shaft) with a wooden hammer. Never hit the casing at this time. Additionally, as seen in the diagram, insertion can be done more smoothly by making and using jigs [a] to [e].
- The output shaft (hollow shaft) is made according to the JIS H8 tolerance. The recommended dimension tolerance of the driven shaft is as follows.
When the load is uniform and a shock does not occur: JIS h6 or js6
When there is an impact load or when the radial load is large: JIS js6 or k6
- The size of the snap ring is in accordance with the JIS B2804, C-type retaining ring.
- When making the driven shaft stepped, please check the shaft stress.

2. Removal from the driven shaft

Be careful not to apply excess force between the casing and the output shaft (hollow shaft).

Removal can be done more smoothly by using the jigs [f] to [i], as shown in the diagram.

3. The length of the driven shaft

The length L, for which the driven shaft is inserted, must be equal to or longer than the recommended length of the driven shaft.

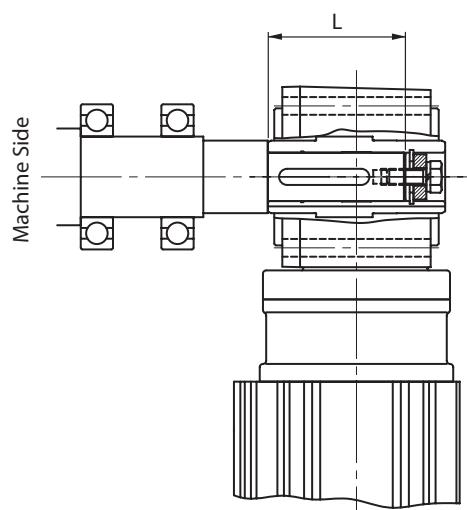

Figure J5 Driven shaft length

Table J4 Recommended length of driven shaft

Frame size	Output shaft bore diameter	Recommended length of driven shaft	Effective length of driven shaft key
HZ522, HZ523, HZ524	Ø 40	108	85
	Ø 45	104	70
HA635	Ø 50	169	110
	Ø 55	159	90

Output Shaft (Hollow Shaft) Handling Document

4. Fixing to the driven shaft

When locking with a torque arm, always fix the drive to the driven shaft.

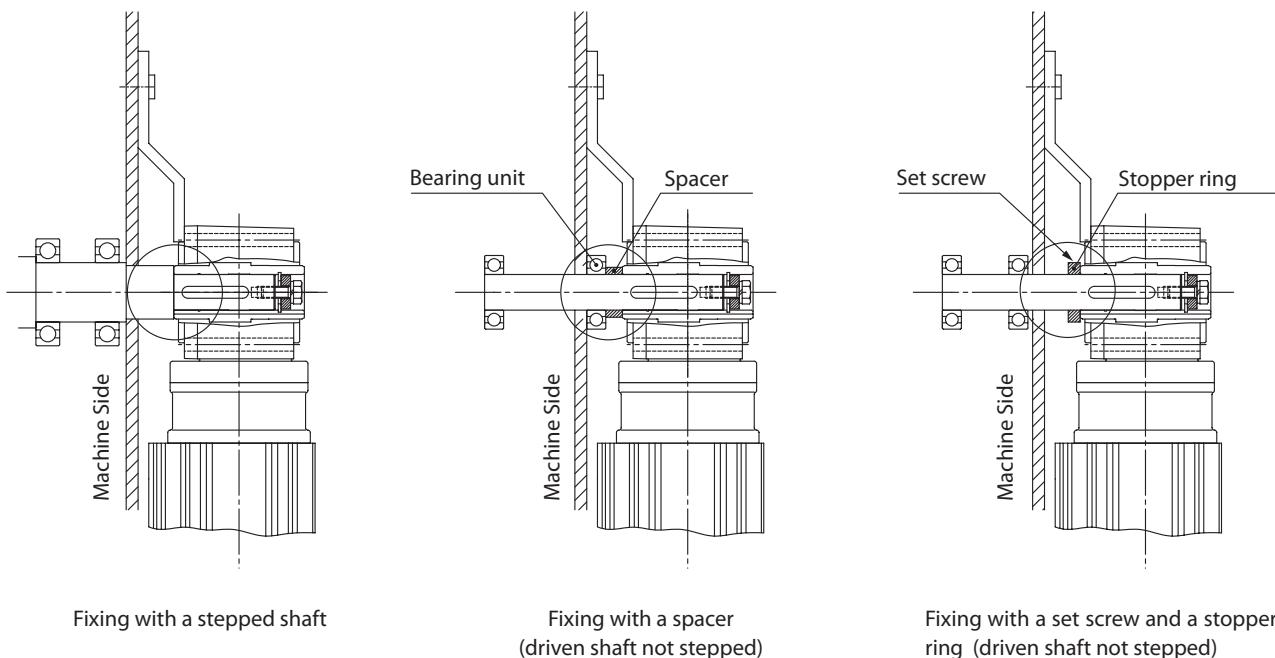

Figure J6 Fixing methods in which the present product does not move to the machine side.

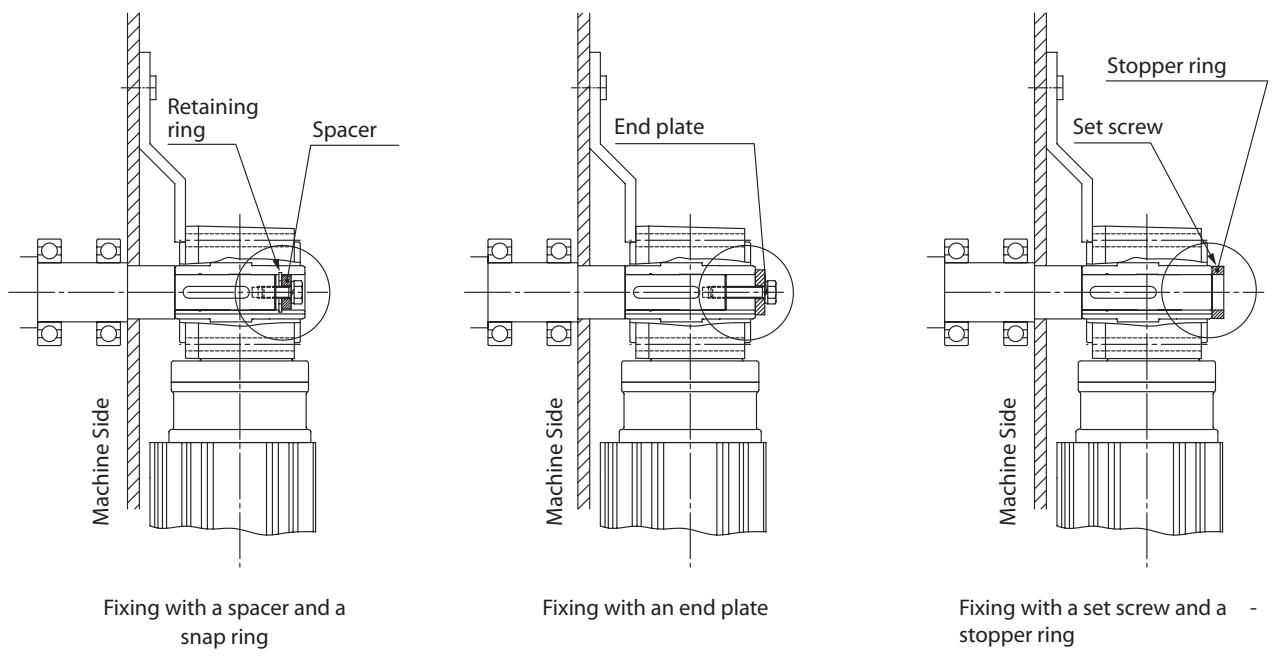

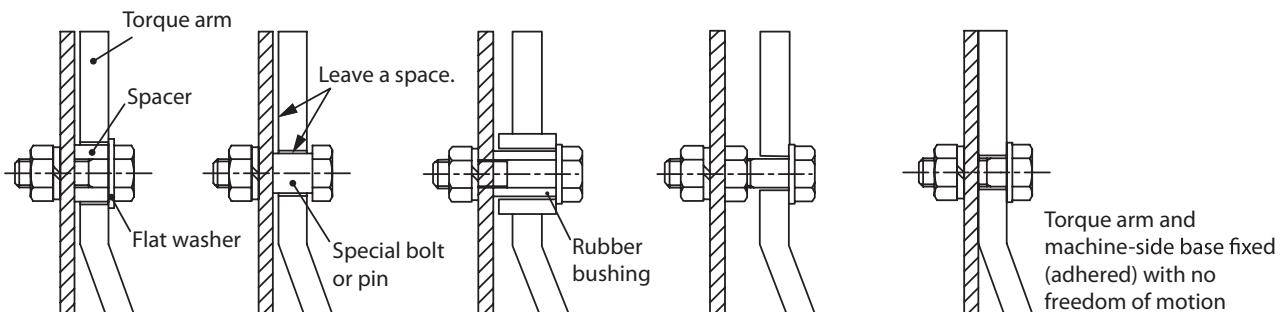

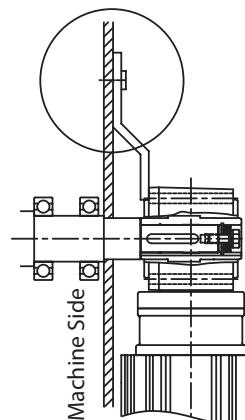

Figure J7 Fixing methods in which the present product does not move to the opposite of the machine.

Output Shaft (Hollow Shaft) Handling Document

5. Locking the torque arm

- [1] Attach the torque arm to the driven machine side of the case. Use a hexagon socket head bolt to mount on the case. (See Table C6 for size)
- [2] Allow a degree of freedom to the locking part of the torque arm so that excess force is not applied between the product and the driven shaft. Never fix the torque arm using a retainer bolt.
- [3] If starting and stopping frequency is high, and when repeating forward and reverse operations, etc., the impact can be mitigated by installing rubber bushing between the torque arm and the mounting bolt (or spacer).

Adjust the amount of the space to a size that does not result in excessive force or contact in accordance with the movement of the machine.

Good example

The retainer bolt, machine or the product may be damaged due to excessive force.

Bad example

Figure J8 Locking part installation example

Table J5 Hexagon socket head bolt size

Frame Size	Bolt size
HZ522, HZ523, HZ524	M12
HA635	M20

Output Shaft (Hollow Shaft) Handling Document

■ Design example of the Torque Arm

The torque arm is prepared by the customer. The designing procedure of the torque arm is shown below. Meanwhile, for applications in which continuous operation and starting/stopping are infrequent, there is an optional torque arm. See page J14 for details.

1. Calculation method of the strength check of the torque arm

Please refer to the following figures and formulas, and check the strength of the torque arm and driven shaft, and the service life of the bearing.

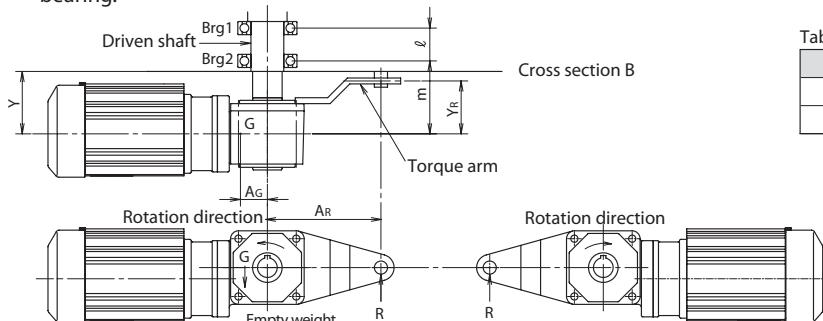

Figure J9: Example design

Table J6	
Frame Size	(m)
HZ522, HZ523, HZ524	0.25
HA635	0.30

(Approximate values)

1. Torque arm load : $R = \frac{T+A_G \cdot G}{A_R}$
2. Brg. 1 load : $B_1 = \frac{m(R-G)-Y_R \cdot R}{\ell}$
3. Brg. 2 load : $B_2 = \frac{(\ell+m)(R-G)-Y_R \cdot R}{\ell}$
4. Bending moment for cross section B of the driven shaft : $M = Y_R \cdot R - Y(R-G)$ but $0 < Y \leq m$

T : Output torque (N·m)

G : Empty weight of drive (N)

R : Torque arm load (N)

AG : Distance from drive shaft center to gravitational center of drive (m)

AR : Distance from drive shaft center to torque arm retainer (m)

YR : Distance from drive center to torque arm retainer (m)

m : Distance from drive center to Brg. 2 (m)

ℓ : Distance from Brg. 1 to Brg. 2 (m)

Y : Distance from drive center to cross section B (m)

Note: Change + to - if the rotation direction of the output torque is opposite from that shown above.

2. Recommended dimensions of the torque arm

Figure J10 Recommended dimensions

Table J7 Recommended dimensions

Frame size	Torque arm length	Torque arm bore diameter	Bore diameter of the torque arm locking part.	Torque arm mounting pitch			Torque arm mounting bore diameter	Torque arm plate thickness
				a	b	c		
HZ522								
HZ523	150	112	22	80	70	—	14	9
HZ524								
HA635	280	152	22	145	85	—	22	12

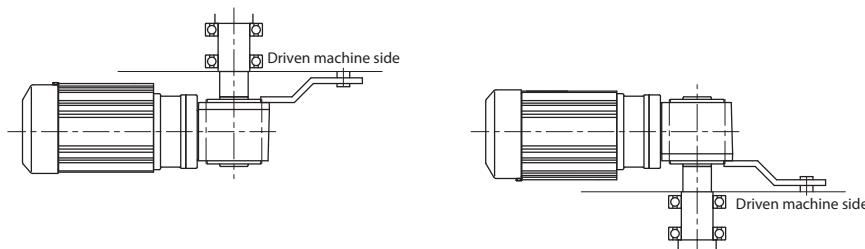

Figure J11 Installation method

- Notes:
1. Attach the torque arm to the driven machine side.
 2. The torque arm is mountable on either the left or right side of the case flange surface.
 3. When mounting on the motor side, beware of interference with the motor.

Output Shaft (Hollow Shaft) Handling Document

■Torque Arm Option

- There is an optional torque arm. This can be used if continuous operation, and starting and stopping are infrequent.
- It cannot be mounted on the motor side from the output shaft (hollow shaft).
- When preparing the torque arm on your own, if starting and stopping is frequent, or if mounting the torque arm on the motor side, please refer to page J13 while carrying out the design.

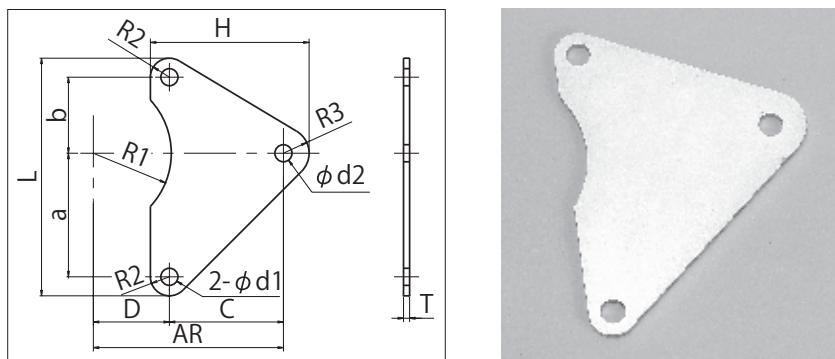

Figure J12 Torque arm

Table J8 Dimension table

Frame size	a	b	c	D	H	L	d1	d2	R1	R2	R3	T
HZ522	80	70	80	–	127	178	Ø 14	Ø 22	–	14	33	9
HZ523												
HZ524												
HA635	145	85	195	85	250	274	Ø 22	Ø 22	80	22	33	12

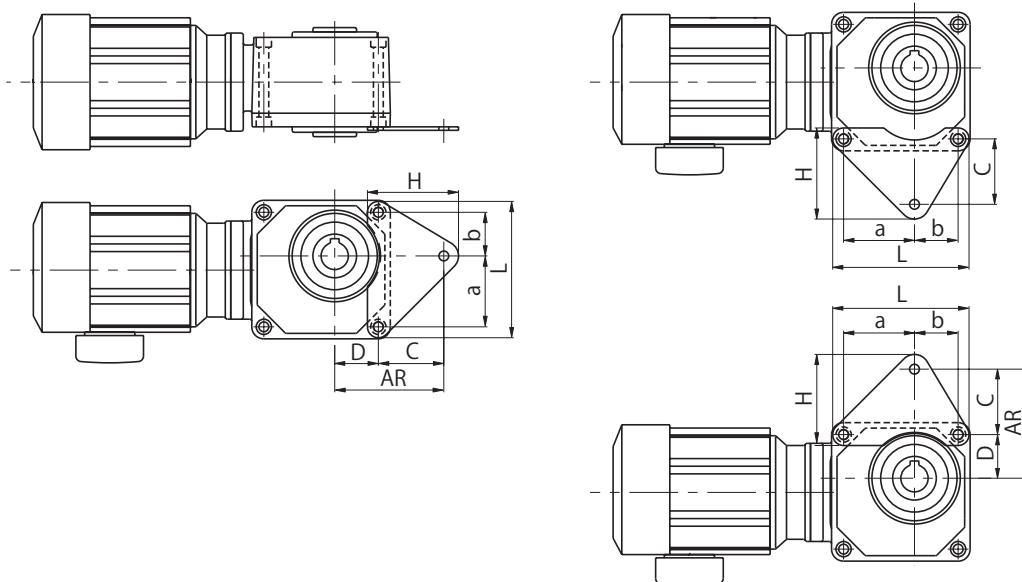

Figure J13 Installation example

- Notes:
1. Please use the torque arm only for the locking function.
 2. Please use the driven shaft to affix the drive in the axial direction.

Output Shaft (Hollow Shaft) Handling Document

■ Safety Cover of the Output Shaft

One safety cover made of resin is attached.

Mounting on either the left or right side is possible.

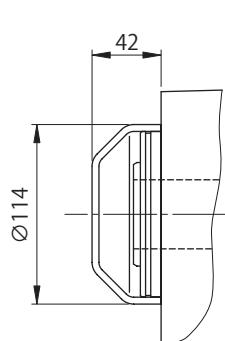

Figure J14 Safety cover (for HZ522, HZ523 and HZ524)

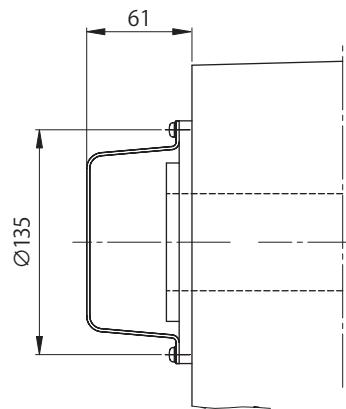

Figure J15 Safety cover (for HA635)

Output Shaft (Hollow Shaft) Handling Document

■ Shrink Disk (Optional)

Design recommendation example

1. Designing the driven shaft

- When ordering the product, the mounting direction of the shrink disk must always be specified. (See Table J11)
- The mounting direction of the shrink disk cannot be changed after delivery.
- Please design the driven shaft with reference to Dimension Table J9.

2. Installation of the shrink disk

- Since the shrink disk is attached to the drive main unit, in a state in which grease is applied to the surface that tightens the boss when shipped, assembly can be carried out as is.
- Inserts that are stuffed between the two plates in transit can be removed by loosening all bolts.
- When removing the shrink disk that has been used so far and reusing it, first disassemble and wash it. Then, apply molybdenum disulfide grease to the surface that will come into contact with the sliding cone, tightening bolt, and its bolt head.

(1) Completely degrease the boss hole and the shaft that comes into contact with it.

(2) Slide the shrink disk onto the output shaft (hollow shaft). Do not tighten the tightening bolts until the driven shaft is inside the output shaft (hollow shaft).

(3) Slide the driven shaft or drive, then insert the driven shaft into the output shaft (hollow shaft).

(4) When tightening the bolts, ensure the surfaces of both plates are parallel. A spanner with a short handle is suitable for this task.

(5) After confirming that the shrink disk is properly set, start tightening the tightening bolts using a spanner with a suitable length.

Tighten the bolts clock-wise (not diagonally), uniformly, and in order, while keeping both plates parallel. Tightening each bolt 30 degrees at a time is recommended when doing this.

(6) Always check the shrink disk after tightening using a torque wrench. The specified torque is indicated on the nameplate of the shrink disk.

(7) Finally, check if both plates are parallel.

Note) Operate after installing the shrink disks by the procedure described above.

There is no lubrication on the contact portion of the output shaft (hollow shaft) and the drive shaft. Therefore, scratches and galling will occur on the shaft if it is rotated without being correctly installed.

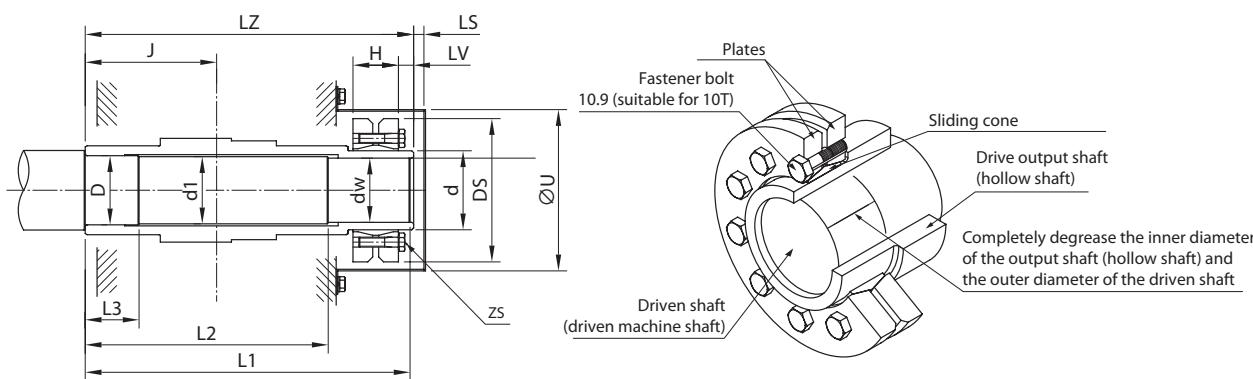

Figure J16 Shrink disk system
Output shaft (hollow shaft) dimensions

Figure J17 Shrink disk structure

3. Removing the shrink disk

- Carry out the removal of the shrink disks in the opposite order of the installation procedure.
- Loosen the bolts gradually and in order, so that the two plates do not tilt on the sliding cone.
- Never remove the bolts if the two plates are not parallel. Both plates may suddenly fly out of the sliding cone and injury is possible. Accordingly, slightly loosen all bolts and insert wedges between the plates to achieve a parallel state.

7.5	FB-10E	80	0.0450	1.65 ~ 1.85	0.55 ~ 0.65						
11	FB-15E	110	0.0602	1.6 ~ 1.8	0.45 ~ 0.55						

- This table summarizes the specifications for the standard brakes. The specifications for the special brakes may differ from those in this table.
- When the motor begins to be used, the predetermined brake torque may be unable to be reached due to the friction surface. In this case, perform lapping of the friction surface by turning on and off repeatedly with the possible lightest load.
- To improve the stopping accuracy or for the lifter, use a fast brake action.
- The lining friction sound may be generated because of the brake construction while the motor is in operation; however, the brake performance is all right.
- When the motor operates with inverter, the noise level from the brake section may increase for the reason of the brake construction; however, the brake performance is all right.
- When a motor with brake operates at a low speed for a long time, the temperature rise of the brake is larger because the cooling effect of the fan decreases. If you desire to use a motor in this manner, use an inverter motor.
- If the motor is used beyond the allowable work E₀, the brake may be failed (braking failure). Make sure that the braking work is not larger than the allowable work E₀. (check this also when the motor needs emergency stop.)

Motors and Brakes

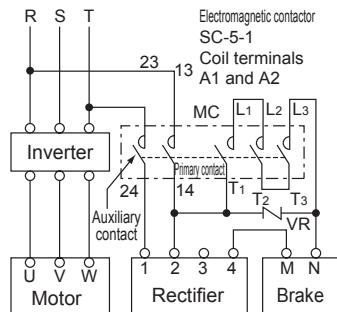

■ Precautions on Using Fast Brake Action

When using a brake with fast brake action, note the following precautions:

- Connect a varistor (protection device) to the brake in order to protect the fast brake circuit contact from surge voltages generated by braking.
- Connect the wire of the fast brake circuit contact to the secondary of the brake power source contact. Otherwise, the contact may not be protected.
- If an AC electromagnetic switch is used for the fast brake circuit contact, refer to below table.

If two or more contacts are required, note the following precautions:

- Connect the electromagnetic contactor contacts in series (refer to Fig.on the right).
- Take the shortest way when connecting the varistor (VR) to the brake (refer to Fig on the right).

Connection example where two or more are used with the Fast Action Brake

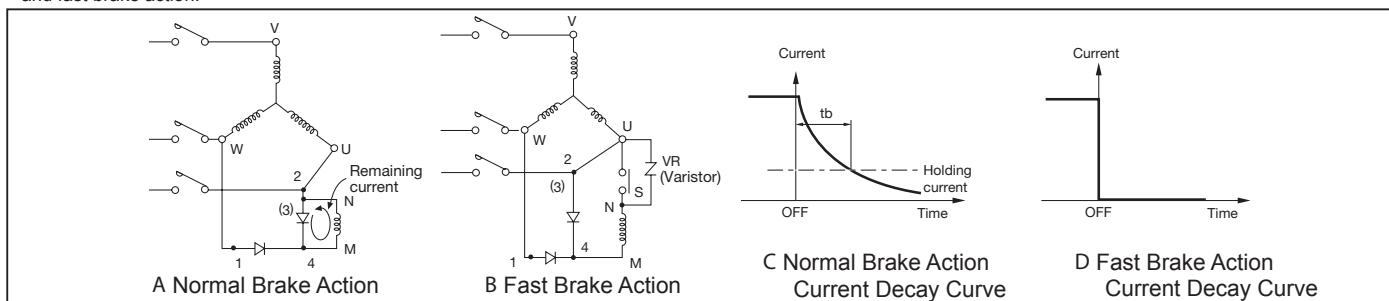

Recommended Contactors and Varistors for Fast Brake Action

AC Voltage	Brake Type	Recommended Contactor Type		Recommended Contactor Contact Capacity (DC-13 Class)	Recommended Varistor (for Contactor Contact)			
		Made by Fuji Electric FA Components & Systems Co., Ltd.	Made by Mitsubishi Electric Corporation		Varistor Type	Maximum Allowable Circuit Voltage	Varistor Voltage

- The above table lists contactors of certain brands. Contactor made by other manufacturers of equivalent performance are acceptable.
- The "Recommended Contactor Contact Capacity" column lists the values assuming the electric switching durability (lifetime) is about 200 million times.
- For the recommended contactors made by Mitsubishi, S-N11 is equipped with one auxiliary contact, and S-N18 is equipped with no auxiliary contact. Note this point if two or more auxiliary contacts are required, for example, for inverter drive. (The other contactors listed in Table EM14 are equipped with two or more auxiliary contacts.)
- The varistor recommended in the above table is manufactured by Nippon Chemi-Con Corporation. Varistor made by other manufacturer with the equivalent performance is acceptable.

Why the fast braking circuit shortens the braking time.

The differences between the normal and fast brake action are as shown in diagrams A and B. Diagrams C and D show how current decay proceeds in the normal and fast brake action.

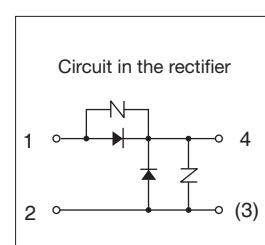

The brake coil has inductance L. For the normal brake action (diagram A), the remaining current flows due to the energy saved in L even after the power is turned off. The remaining current decays as shown by the curve in diagram C.

When it is connected for the fast brake action in diagram B and S is released at the same time the power goes off, the closed circuit with the brake coil is not made; the remaining current stops as shown in diagram D.

Therefore, it shortens the braking time by time t_b , resulting in fast braking. In summary, the fast brake action circuit stops the remaining current in response to turning on or off the brake coil at the same time when the power goes on or off.

(VR varistor must be used to protect the rectifier and contact S.)

Motors and Brakes

■ Calculation of Braking Work and Braking Time

○Braking Work E_B (J, kgf·m)

The braking work, which varies significantly depending on the speed or load conditions of the motor, can be obtained by using the formulas below:

[International System of Units]

$$E_B = \frac{(J_L + J_M) \cdot N^2}{182} \times \frac{T_B}{T \pm T} \quad (J)$$

J_L : Total moment of Inertia for motor without brake (converted at motor shaft) [kg·m²]

J_M : Moment of Inertia for motor with brake [kg·m²]

N : Motor speed at braking timee [r/min]

T_B : Braking Torque [N·m]

T_R : Load Torque [N·m]

[Gravitational System]

$$E_B = \frac{(GD_L^2 + GD_M^2) \cdot N^2}{7150} \times \frac{T_B}{T_B \pm T_R} \quad (\text{kgf}\cdot\text{m})$$

GD_L^2 : Total moment of Inertia for motor without brake (converted at motor shaft) [kg·m²]

GD_M^2 : Moment of Inertia for motor with brake [kg·m²]

N : Motor speed at braking timee [r/min]

T_B : Braking Torque [N·m]

T_R : Load Torque [N·m]

Sign of T_R +: When turnig off the power, the load torque works as the brake (positive load)

- : When turning off the power, the load torque does not work as the brake (negative load)

Obtain the work per minute from both the braking work E_B and the number of braking times per minute (note), and check that it is equal to or small than the allowable work E_0 .

In addition, if the brake operates after the speed slows by the inverter or the like, consider the braking energy generated from high-speed rotation as well, taking into account an emergency stop that is due to a blkout.

If it is used beyond the allowable work, the brake friction surface, decrease in brake torque, damage of the lining, etc. The brake allowable work is for checking the temperature rise on the brake friction surface. In addition, consider the gearmotor start and stop frequencies.

Note: If the brake works once every several minutes to several hours, obtain the work assuming that the frequency is 1 time per minute.

○Braking Time t_B (sec)

[International System of Units]

$$t_B = \frac{(J_L + J_M) \times N}{9.55 \times (T_B \pm T_R)} + t_D \quad (\text{sec})$$

J_L : Total moment of Inertia for motor without brake (converted at motor shaft) [kg·m²]

J_M : Moment of Inertia for motor with brake [kg·m²]

N : Motor speed at braking timee [r/min]

T_B : Braking Torque [N·m]

T_R : Load Torque [N·m]

t_D : Operation Lag Time [sec]

[Gravitational System]

$$t_B = \frac{(GD_L^2 + GD_M^2) \times N}{375 \times (T_B \pm T_R)} + t_D \quad (\text{sec})$$

GD_L^2 : Total moment of Inertia for motor without brake (converted at motor shaft) [kg·m²]

GD_M^2 : Moment of Inertia for motor with brake [kg·m²]

N : Motor speed at braking timee [r/min]

T_B : Braking Torque [N·m]

T_R : Load Torque [N·m]

t_D : Operation Lag Time [sec]

Sign of T_R +: When turnig off the power, the load torque works as the brake (positive load)

- : When turning off the power, the load torque does not work as the brake (negative load)

○Lining Lifetime Z_L (times)

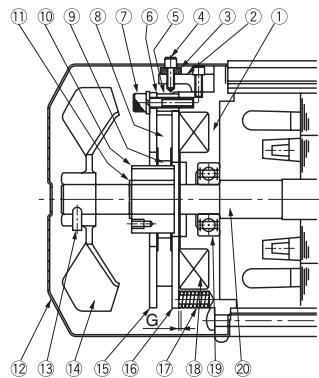

The brake lining is worn away by being used. The abrasion significantly varies with friction surface, slipping velocity, ambient conditions, temperature, and other factors; the accurate lifetime can hardly be calculated. An approximate lifetime (times) can, however, be obtained using the following formula:

$$Z_L = \frac{E_t}{E_B} \quad [\text{times}]$$

E_t : Total Work [J]

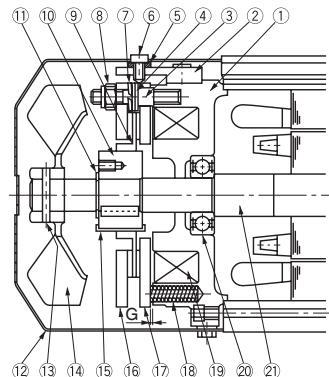

Brake Construction Drawing

FB-1E~4E (0.75~3.0kW x 4 poles)

■ Manual Releasing of FB Brake

To release the brake manually, follow the steps as below:

■ Release two of the brake releasing bolts diagonally and remove the spacer. Then put back the bolts with a hexagon wrench until the brake will be released. Carefully screw the releasing bolts as the brake is being released.

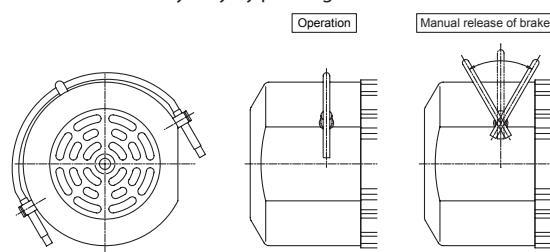

■ After the brake is released, put back the spacer in place for safety.

Note: Brake release unit is supplied as standard specifications to FB-1E and above.

■ Brake Release Lever (optional)

A manual hand release lever, as an option, may be attached to the motor. Designate it, if necessary, when placing the order. The brake can be released manually only by pushing down the lever.

Operating procedure of Manual Release:

- To release the brake, pull the lever from the holder, and turn it down toward the load or anti-load side.
- When the motor is in operation (the brake is actuated), be sure to return the lever to the holder.

Note: Before starting the motor, make sure the brake is actuated.

Wiring Connection

Moment of Inertia / GD²

■ Moment of Inertia / GD² and Starting Time

To start the driven machine completely, the starting torque has to be sufficiently larger than the load torque and the motor torque has to exceed the load torque constantly from the start of operation to the achievement of the full-load speed.

The acceleration torque is the difference between the motor torque and the load torque during the starting period. Assuming the average acceleration torque to be \bar{T}_a (N·m, kgf·m), the starting time t_s (s) until the rotation speed n (r/min) is calculated by the following formula using the moment of inertia or GD^2 .

$$t_s = \frac{(J_M + J_C + J_L)/n}{9.55 \cdot \bar{T}_a} \quad (\text{s})$$

$$t_s = \frac{(GD_M^2 + GD_C^2 + GD_L^2)/n}{375 \cdot \bar{T}_a} \quad (\text{s})$$

However, J_M : Inertia moment of the motor (including the brake drum) (kg·m²)

J_C : Inertia moment of CYCLO Drive (kg·m²)

J_L : The moment of inertia (kg·m²) of driven machines (including couplings and pulleys) converted to the motor shaft.

GD_M^2 : GD^2 of the motor (including brake drum) (kgf·m²)

GD_C^2 : GD^2 of the cyclo drive (kgf·m²)

GD_L^2 : GD^2 (kgf·m²) of driven machines (including couplings and pulleys) converted to the motor.

Average acceleration torque \bar{T}_a

Here the average torque means the difference between the motor torque and load torque as shown in the right figure, which is the average value of the actual torque to accelerate the load. To calculate the starting time, the motor torque curve and load torque curve are required. However, in this method, it is very difficult to calculate the average acceleration torque, so the average acceleration torque with the actual load is calculated as follows:

In the case of full voltage starting, \bar{T}_a [N · m, kgf · m] of the average acceleration torque during the starting period is calculated approximately by the following formula.

$$\bar{T}_a \doteq 0.8 \left(\frac{T_s + T_m}{2} \right) - \bar{T}_L (N \cdot m, \text{kgf} \cdot m)$$

Also, the average load torque \bar{T}_L (N · m, kgf · m) during the starting period will be as follows if the motor full-load torque is T_L :

In the case of constant load torque: $\bar{T}_L \doteq T_L$ (N · m, kgf · m)

In the case of double reduction torque: $\bar{T}_L \doteq 0.34T_L$ (N · m, kgf · m)

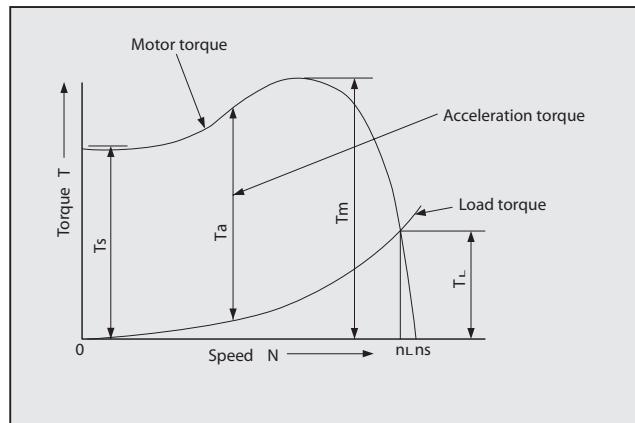

Figure C3 Torque diagram

T_s : Starting torque

T_m : Maximum torque (stall torque)

T_a : Acceleration torque

T_L : Full-load torque

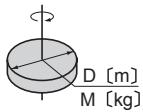

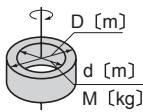

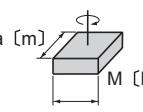

n_s : Synchronization rotation speed

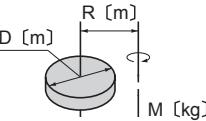

n_L : Full-load rotation speed

Moment of Inertia / GD²

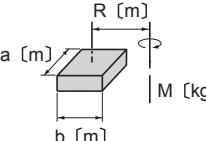

■ Calculation Method for the Moment of Inertia J

(1) Inertia moment of the rotor

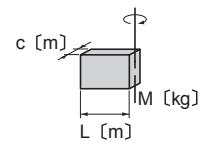

If the rotation shaft passes through the center of gravity	If the rotation shaft does not pass through the center of gravity
 D [m] M [kg]	$J = \frac{1}{8}MD^2 [\text{kg}\cdot\text{m}^2]$
 D [m] d [m] M [kg]	$J = \frac{1}{8}M(D^2+d^2) [\text{kg}\cdot\text{m}^2]$
 a [m] b [m] M [kg]	$J = \frac{1}{12}M(a^2+b^2) [\text{kg}\cdot\text{m}^2]$

$$J = \frac{M}{4} \left(\frac{1}{2} D^2 + 4R^2 \right) [\text{kg}\cdot\text{m}^2]$$

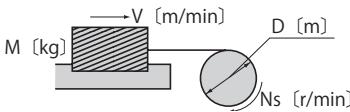

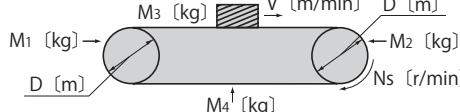

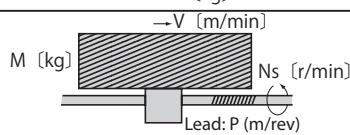

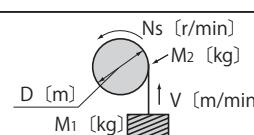

$$J = \frac{M}{4} \left(\frac{a^2+b^2}{3} + 4R^2 \right) [\text{kg}\cdot\text{m}^2]$$

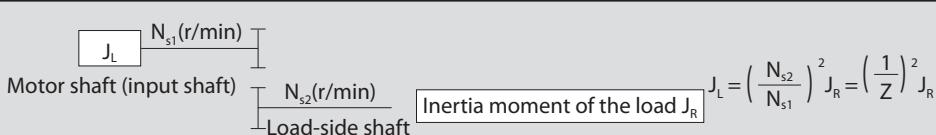

$$J = \frac{1}{12}M(4L^2+C^2) [\text{kg}\cdot\text{m}^2]$$

(2) Inertia moment of the linear motion (inertia moment in the load-side shaft)

General purpose		$J = \frac{M}{4} \left(\frac{V}{\pi \cdot N_s} \right)^2 = \frac{M}{4} D^2 [\text{kg}\cdot\text{m}^2]$
Horizontal movement by the conveyor		$J = \frac{1}{4} \left(\frac{M_1+M_2+M_3+M_4}{2} \right) \times D^2 [\text{kg}\cdot\text{m}^2]$
Horizontal movement by the lead screw		$J = \frac{M}{4} \left(\frac{V}{\pi \cdot N_s} \right)^2 = \frac{M}{4} \left(\frac{P}{\pi} \right)^2 [\text{kg}\cdot\text{m}^2]$
Vertical movement by the hoisting machine		$J = \frac{M_1 D^2}{4} + \frac{1}{8} M_2 D^2 [\text{kg}\cdot\text{m}^2]$

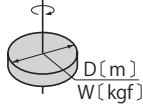

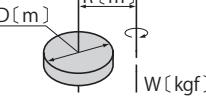

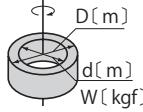

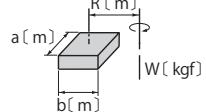

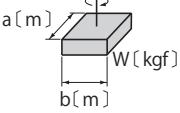

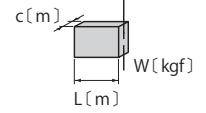

(3) Conversion to the motor shaft (input shaft)

	$J_L = \left(\frac{N_{s2}}{N_{s1}} \right)^2 J_R = \left(\frac{1}{Z} \right)^2 J_R$
Z: Total reduction ratio	

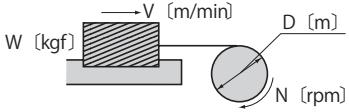

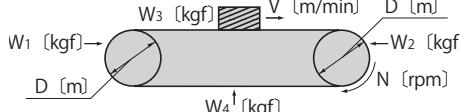

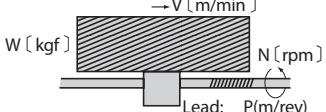

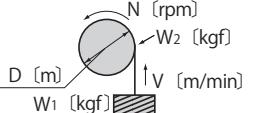

Moment of Inertia / GD²

■ Calculation Method for GD²

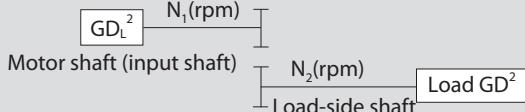

(1) GD² of the rotor

If the rotation shaft passes through the center of gravity	If the rotation shaft does not pass through the center of gravity	
 $D \text{ [m]}$ $W \text{ [kgf]}$	$GD^2 = \frac{1}{2} WD^2 \quad [\text{kgf}\cdot\text{m}^2]$  $R \text{ [m]}$ $W \text{ [kgf]}$	$GD^2 = W \left(\frac{1}{2} D^2 + 4R^2 \right) \quad [\text{kgf}\cdot\text{m}^2]$
 $D \text{ [m]}$ $d \text{ [m]}$ $W \text{ [kgf]}$	$GD^2 = \frac{1}{2} W(D^2 + d^2) \quad [\text{kgf}\cdot\text{m}^2]$  $a \text{ [m]}$ $b \text{ [m]}$ $W \text{ [kgf]}$	$GD^2 = W \left(\frac{a^2 + b^2}{3} + 4R^2 \right) \quad [\text{kgf}\cdot\text{m}^2]$
 $a \text{ [m]}$ $b \text{ [m]}$ $W \text{ [kgf]}$	$GD^2 = \frac{1}{3} W(a^2 + b^2) \quad [\text{kgf}\cdot\text{m}^2]$  $c \text{ [m]}$ $L \text{ [m]}$ $W \text{ [kgf]}$	$GD^2 = \frac{1}{3} W(4L^2 + C^2) \quad [\text{kgf}\cdot\text{m}^2]$

(2) GD² of the linear motion (GD² in the load side)

General purpose	 $W \text{ [kgf]}$ $V \text{ [m/min]}$ $D \text{ [m]}$ $N \text{ [rpm]}$	$GD^2 = W \left(\frac{V}{\pi/N} \right)^2 = WD^2 \quad [\text{kgf}\cdot\text{m}^2]$
Horizontal movement by the conveyor	 $W_1 \text{ [kgf]} \rightarrow$ $D \text{ [m]}$ $V \text{ [m/min]}$ $D \text{ [m]}$ $W_2 \text{ [kgf]} \leftarrow$ $W_3 \text{ [kgf]} \rightarrow$ $W_4 \uparrow \text{ [kgf]}$ $N \text{ [rpm]}$	$GD^2 = \left(\frac{W_1 + W_2}{2} + W_3 + W_4 \right) \times D^2 \quad [\text{kgf}\cdot\text{m}^2]$
Horizontal movement by the lead screw	 $W \text{ [kgf]}$ $V \text{ [m/min]}$ $N \text{ [rpm]}$ Lead: $P \text{ (m/rev)}$	$GD^2 = W \left(\frac{V}{\pi/N} \right)^2 = W \left(\frac{P}{\pi} \right)^2 \quad [\text{kgf}\cdot\text{m}^2]$
Vertical movement by the hoisting machine	 $N \text{ [rpm]}$ $W_2 \text{ [kgf]}$ $D \text{ [m]}$ $W_1 \text{ [kgf]}$ $V \text{ [m/min]}$	$GD^2 = W_1 D^2 + \frac{1}{2} W_2 D^2 \quad [\text{kgf}\cdot\text{m}^2]$

(3) Conversion to the motor shaft (input shaft)

 Motor shaft (input shaft) GD_L^2 $N_1 \text{ (rpm)}$	$GD_L^2 = \left(\frac{N_2}{N_1} \right)^2 GD^2 = \left(\frac{1}{Z} \right)^2 GD^2$ Z: Total reduction ratio
---	--

6 (Complete dust-proof type)						IP65			

Note 1: X mark denotes difficulty in forming the combination.

Note 2: □ Outlined columns denote the manufacturing range of Sumitomo.

Note 3: Contact us for motors of JP45 and JP55.

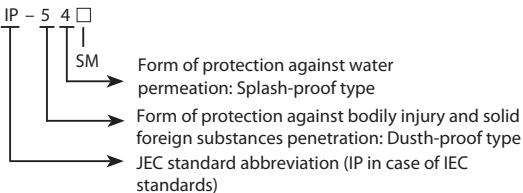

Class of No.1 Symbol

Type	Symbol	Description
Non-protected	0	Constructed without special protection against human contact and penetration of solid foreign substances.
Semi-protected	1	Constructed to prevent inadvertent contact with rotating and conductive parts inside the machine, by hand or other critical parts of human body. Constructed to prevent penetration of solid foreign substances over 50 mm in diameter.
Protected	2	Constructed to prevent contact with rotating and conductive parts inside the machine, by hand or other critical parts of the human body. Constructed to prevent penetration by solid substances over 12mm in diameter.
Totally enclosed	4	Constructed to prevent contact with the rotating and conductive parts inside the machine, by tools, electric wires, etc., with minimum width and thickness over 1mm. Constructed to prevent penetration of solid foreign substances over 1mm diameter. However, water drainage outlet and exhaust outlet may be of Symbol 2 construction.
Dust-proof type	5	Constructed to prevent contact with rotating and conductive parts inside the machine by any form of object. Constructed for maximum protection against dust particles penetration, but will not interfere with normal operation, despite of such penetration.
Complete dust-proof type	6	Constructed for complete protection against dust particles penetration.

Class of No.2 Symbol

Type	Symbol	Description
Non-protected	0	Constructed without special protection against water permeation.
Drip-proof	2	Constructed to prevent harmful effect from dripping water falling from within 15° direction from vertical.
Spray-proof	3	Constructed to prevent harmful effect from dripping water falling from within 60° direction from vertical.
Splash-proof	4	Constructed to prevent harmful effect from dripping water falling from any direction.
Water-jet-proof	5	Constructed to prevent harmful effect from spray from any direction.
Sea-wave-proof	6	Constructed to prevent harmful effect from strong spray from any direction.
Immersion-proof	7	Constructed for submersion into water of prescribed depth and time, but not having any harmful effect in spite of water permeation.
Submersible	8	Constructed to assure normal operations under water.

Example:

S Test of form of protection against water permeation, conducted when motor is stopped
 M Test of form of protection against water permeation, conducted when motor is operating
 When no S or M stipulated Test conducted when motor stopped and when operating

■ International Standards And Compliance Of Sumitomo Products

CCC Standards (China Compulsory Certification)

China had implemented the China Compulsory Certification (CCC) system since May 1, 2002 as becoming the full member of World Trade Organization (WTO). They have moved on to compulsory licensing on August 1, 2003. Motor capacity 1.1kW and below are subject to this certification, and requires CCC Mark for sales in China. Below table is our motor with CCC.

Motor	Single Phase Motor		Three Phase Motor		AF Motor	AF Motor (Foot Mount)
Capacity	15~90W	0.1~0.75W	40~90W	0.1~1.1W	0.1~0.75W	0.4~0.75W
Voltage	220V		220 or 380V			
Frequency	50Hz				50Hz	
Thermal Class	Class E	Class B	Class E	Class F		
Usage	indoor (IP44), Outdoor (IP55)		indoor (IP44), Outdoor (IP55)			

AF motor: 3 Phase Motor for inverter

Difference with standard items

- CCC Mark as in the right is applied on the nameplate.
- Aluminum terminal box is the standard for three phase motor (except indoor specification for 40~90W).
- Terminal block type (6 terminals, European system) is the standard for three phase motor (for 0.1kW or more).
- Rotational direction is the opposite from Japanese domestic specification (in CCW direction looking from the anti-load side).
- CCC correspondence motor coil is used.

China Compulsory Certificate

Remarks

- CCC Mark is necessary when exporting small size motor (or gear motor) units of 1.1kW or below to China.
 - Subject service products and spare parts without certification may be permitted for import to China by applying for exemption.
- Consult us for any clarification.

GOST-R Standard (Russian Gosstandard)

GOST-R Standard is a national certification system determined by State Committee of Russian Federation for Standardization and Metrology.

Any product distributed in the Russian Federation requires certification. Especially products subject to compulsory certification are not allowed to export to Russian Federation without this certification.

Sumitomo offers motors conforming to GOST-R specification for export to Russia, because motors are subject to compulsory certification.

Our Certified Motor Specification (Range other than the below is the same as CE Marking of Europe.)

Motor	General Motor				Inverter motor (AF Motor)			
	Without Brake	With Brake	Without Brake	With Brake	Without Brake	With Brake	Without Brake	With Brake
Capacity x 4P	0.1~3.7kW	5.5kW	0.1~3.7kW	5.5kW	0.1~2.2kW	3.7kW	0.1~2.2kW	3.7kW
Motor voltage	220/380V	380V	220/380V	380V	220/380V	380V	220/380V	380V
Brake voltage	-	-	220V	380V	-	-	220V	380V
Frequency	50Hz				60Hz			
Thermal class	F				F			
Rating	S1 (continuous)				S1 (continuous)			
	indoor (IP44), Outdoor (IP55)				indoor (IP44), Outdoor (IP55)			
Starting	Dual voltage inline	λ - Δ	Dual voltage inline	λ - Δ	-			

AF motor: 3-Phase Motor for inverter

Difference Compared to Standard Japanese Product

- Nameplate is marked with GOST-R Mark (as shown in the right).
- Standard terminal box is made of Aluminum
- The motor has terminal block (European type with 6 terminals).
- Rotation direction is counterclockwise viewed from fan cover side (opposite from Japanese specification).
- Motor coil is certified for GOST-R.

GOST-R Mark

Cautions

- Uncertified products cannot pass through customs when exported to Russia. (No specific certification is necessary when the unit is exported to Russia as a part of the machine.)
 - A verified copy of the certification is necessary when exporting the individual unit for each case (each ship).
- Let us know when ordering the units which are not included in an apparatus or not built into the exported apparatus.

Compliance of International Standards

CE MARKING

The CE mark is to be affixed to products that conform to EC directives, in order to certify the quality and safety of products and ensure free distribution of products across borders within the region of the EU (European Union).

EC directives applicable to machine products and implementation period

The following three directives apply to ordinary machine products.

EC directives	Details	Objects	Details of directive
Machinery directive		Aggregates of parts, which are movable (Industrial machines, primarily)	Essential matters related to safety of machines are stipulated. Machines that are electrically dangerous shall fulfill the requirements for low voltage.
Low Voltage Directive		Products driven by power of 50~1,000 VAC or 75~15,000 VDC	Products not conforming to standards can not be put on the market.
EMC Directives Electromagnetic Compatibility Directive		All types of products that may cause jamming (electromagnetic radiation) or have their functions impeded by nearby radio waves	EMI : Not to cause external electromagnetic interference EMS : To withstand external electromagnetic interference

Standard Specifications of CE Marking Motors

Input power	: 15W~90W 200V 50Hz Direct start-up 0.1W~4W 230/400V 50Hz Dual voltage direct starting 5.5W or more 400V 50Hz Δ-△start
Insulation	: 15W~0.4kW Class E 0.75W or more Class B
Rated time	: Continuous
Characteristics	: IEC34-1
Protection	: P54 (without brake), IP44 (with brake) 15W~90W : Aluminum (M20 bolts(P1.5) × 1pc)
Terminal box	: (Material) 5.5kW or less : Aluminum (PG16 bolts × 2pcs or M25 bolts (P1.5) × 2pcs) 7.5kW or more : Cast Iron (PG21 bolts × 2pcs or M32 bolts (P1.5) × 2pcs) : (Specification) Terminal Plate (six terminals, European style) with grounding terminal Conduit tube European size* (PG thread or M thread) *different from Japanese standard of conduit tube PF thread. Models of 15W~90W contain M thread and cable ground (applicable lead diameter P6.0~12)
Shaft rotating direction	: Rotating direction is reverse to Japanese standard direction.
Insulation	: Distances between insulated surfaces and spaces in accordance with IEC standards.
External dimensions	: Same as standard except for the terminal box. Length might vary in some cases for models 90W or less.
TÜV test report	: Acquired for a representative model 0.75kWx4P, 230V/400V (Oct 1996) CE marking motors are manufactured in accordance with the model
Declaration of Conformity	: Declaration of Conformity is available when necessary for CE marking

Manufacturing range of CE Marking motors

3-phase induction motor

	230/400V dual voltage													
Input power symbol	0.015	0.025	0.04	0.06	0.09	0.1	0.12	0.18	0.2	0.3	0.4	0.5	0.8	1
kWx4P	(0.015)	(0.025)	(0.04)	(0.06)	(0.09)	(0.1)	0.12	0.18	(0.2)	0.25	0.37	(0.4)	0.55	0.75
Frame	F50S	F50M	F50L or F56S	F50L or F56M	F56L	V63S				V63M		V71M	V80S	V80M
	230/400V dual voltage						400V							
Input power symbol	1H	2	3	4	5	6	8							
kWx4P	1.1	1.5	2.2	3	(3.7)	4	5.5							
Frame	V90S	V90L	V100L	V112S	V112M	V132S								

- Motors of kW without brackets () in the above table are standard in Europe while motors of kW with brackets () are used only in Japan and other countries.
- European standard kW motors are recommended. Motors of kW with brackets () are also available.
- 3-phase 200V/50Hz, 200V/60Hz, 220V/60Hz 3-phase 400V/50Hz, 400V/60Hz, 440V/60Hz 3-phase 380V/50Hz, 3P 415V/50Hz
- Contact us when motors of kW and voltage not shown in the above table are required.
- Consult us when M bolt (Metric bolt) is needed for conduit tube.

Measures to take for EC directives and CE marking related to gear motors

Among EC directives, the machinery directive (issued in January 1995) concerning induction motors and low voltage directive (issued in January 1997) are applicable.
The EMC directive (issued in January 1996) does not apply to induction motors.

CE marking logo shown on nameplates

Compliance of International Standards

UL Standards

(Underwriters Laboratories)

UL Standards are established for safety by a commercial testing institute in the US to prevent harmful effect to human life, fire and disaster based on a series of scientific study, research and experiment. It is not regulated to comply with the standards by Federal Government, but it is regulated by some states or cities. Approved products by UL standards are highly appreciated in the US to represent your reliability.

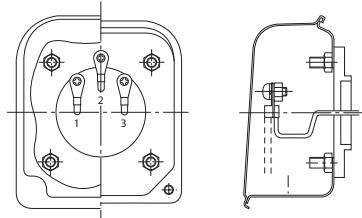

- 1. Single-phase motor or motor w/brake is manufactured in the range of 1/50 through 1/9 HP.
- 2. Outdoor type is available. Please consult us.
- 3. F-class insulation type is available. Please consult us.
- 4. For other voltages or frequencies, please consult us.

Differences from Sumitomo standard models

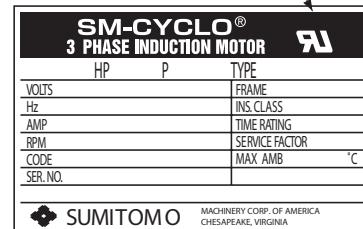

- Terminal symbol: 1,2,3
- Name plate with UL mark and measurement in HP
- Opposite rotating direction
- Copper terminal box
- UL standard motor coil and brake coil

Remarks

- Manufacturing and repair work may be conducted only at authorized factories.
- Motor for inverter is excluded from UL approval. Sumitomo supplies UL compliant AF motor. (UL mark is not fixed on a nameplate of UL compliant products.)

3-Phase indoor terminal box

UL nameplate

CSA Standards

(Canadian Standard Association)

National standards established by a semi-governmental organization in Canada. Most states in Canada require electronic products to be approved by CSA. CSA is considered equivalent in some states in the US.

Motor	3-phase induction motor	3-phase induction motor with brake	High efficiency 3-phase induction motor *1	High efficiency 3-phase induction motor with brake *1
Power	1/8~1HP×4P	1/8~1HP×4P	1.5~5HP×4P	1.5~5HP×4P
Voltage	208V, 230V, 460V, 575V		230V, 460V, 575V	
Frequency		60Hz		
Insulation		Class B (and Class F)		
Ambient conditions		Indoor type *2		

*1: Contact us for manufacture of a single-phase motor or a high-efficiency motor with brake.

*2: Outdoor type not supplied

*3: Some 1/50 through 1/9HP 4P are CUL approved products which are permitted for use in Canada.

Differences from Sumitomo standard models

- Terminal symbol: 1,2,3 (with Brake type, T₁, T₂, T₃)
- The frame size of a high-efficiency motor is special.
- Name plate with CSA mark and measurement in HP
- Opposite rotating direction
- Copper terminal box
- CSA standard motor coil

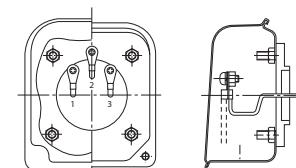

Remarks

- If exporting to Canada, it should be CSA approved motor and if above 1HP, high efficiency motor is needed.

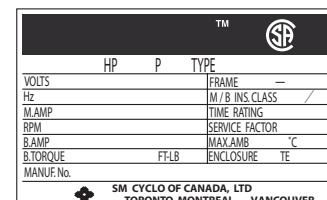

- Manufacturing and repair work may be conducted only at authorised factories.

- Motor for inverter is excluded from CSA approval. Sumitomo supplies CSA compliant AF motor (CSA mark is not fixed on a nameplate of CSA compliant products).

NRCan established the energy efficiency act (EEACT) in 1992 and the energy regulations (EER) in 1995, and additional regulations were applied to gear motors imported on November 27, 1999 or later. Import of gear motors that do not meet the efficiency standards has been banned. This rule applies to the following motors : 1-200HP, IEC frame 90 and larger, 600V or less, constant speed.

3-Phase indoor terminal box

CSA nameplate

Compliance of International Standards

NEMA Standards (National Electrical Manufacturers Association)

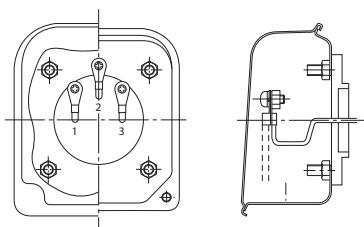

Established by a manufacturers' association to provide standards of most electrical products for both manufacturers and consumers.

Differences from Sumitomo standard models

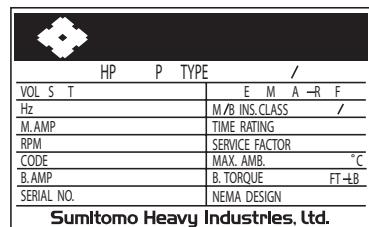

- Terminal symbol: 1,2,3
 - Name plate marked with NEMA DESIGN and measurement in HP
 - Opposite rotating direction
 - Copper terminal box
- NEMA standard motor coil

Remarks

- No approval is required to state NEMA compliance.
- NEMA is also applicable for inverter motor, but limited to terminal symbols, measurement in HP, rotating direction and terminal box.

3-Phase indoor terminal box

NEMA nameplate

Other standards

Major Japanese Standards

(1) General rotating electrical machines

- JIS C 4004 (1992) : General rules for rotating electrical machines
JEC-200 (1993) : Rotating machinery in general
JEM 1188 (1969) : Rated output values of electric motors

(2) General 3-phase induction motors

- JIS C 4210 (1983) : Low-voltage 3-phase squirrel cage induction motors for general purpose
JIS C 4212 (2000) : High efficiency low-voltage 3-phase squirrel cage induction motors
JEC-37 (1979) : Induction machines

(3) Methods of testing and calculating characteristics

- JEC-37 (1979) : Induction machines
JIS C 4207 (1993) : Calculating method of 3-phase induction motors characteristics

(4) Dimensions

- JEM 1400 (1991) : Dimension of low-voltage 3-phase squirrel cage induction motors for general purposes
JEM 1401 (1991) : Dimensions of flange-mounted low-voltage 3-phase squirrel cage induction motors for general purposes

(5) Explosion-proof construction

- JIS C 0903 (1983) : Electrical apparatus for explosive atmospheres in general industries

JIS C 0904 (1983) : Test methods on electrical apparatus for explosive gas atmospheres in general industries

JIS C 0905 (1983) : Supplementary requirements for construction of electrical apparatus for explosive atmosphere in general industries

Recommended practices for explosion-protected electrical installations in general industries (1979)

Rules for authorization of explosion-proof construction of electrical machine tools (1981)

(6) Others

JIS C 4003 (1977) : Classification of materials for insulation of electrical machinery and apparatus

JEC-147 (1960) : Classification of materials for insulation of electrical machinery and apparatus

JEM 1313 (1983) : Noise levels for low-voltage 3-phase squirrel-cage induction motors for general purpose

Remarks: JEC Japanese Electrotechnical Committee Standards

JIS Japanese Industrial Standard

JEM Japan Electrical Manufacturers' Association

Safety Precautions

SAFETY PRECAUTIONS

- Strictly Observe the safety rules required for the installation site and the equipment used, including the Industrial Safety and Health Law, Technical Standard for Electric Facilities, Extension Rules, Plant Explosion guidelines, and Building Standards Law.
- Read the maintenance manual before use. Request one from the distributor or our sales department to send it, if it is not handy. The maintenance manual must reach every end user of the product.
- Select an appropriate product matching the operating environment and your application.
- If you are using the product for any equipment that may cause severe personal injury or severe loss of the facilities when it fails (e.g., transporting or elevating system for personnel), install a protection device on the equipment for the safety purpose.
- In an explosive atmosphere, use an explosion proof motor that has a specification adaptable to use in hazardous locations.
- If the motor is being driven with a 400V Class inverter, install a suppression filter or reactor on the inverter, or use an insulation enhanced motor.
- When a 400V Class standard motor is being inverter driven, a high carrier frequency type (e.g., IGBT) inverter with high input voltage or, for long wiring distance, insulation for surge voltage must be considered. Consult us for details. (The inverter motors are of insulation-enhanced type.)
- Specifically for oil-sensitive applications such as processing and clean room, install an oil pan or other devices to prevent oil or grease leakage, which may occur due to failure or termination of service life.

CAUTIONS ON APPLICATION OF SPECIAL MOTORS

- Explosion proof motor: No increased safety motor can be inverter driven. If you need to inverter drive an explosion proof motor, you have to use a flame-proof motor for combination. Consult us for details.
- Motor with brake: An independent power source for the brake must be provided. This power source must always be connected to the primary of the inverter, and the inverter output must be shut off during actuation of the brake. The motor depending on the brake type may rattle in the low-speed area due to running.

Warranty Standard

Warranty Period	The warranty period shall be 18 months from the date of shipment from the factory or 12 months from the start date of operation of the product, whichever is shorter (this shall apply only to new products).
Warranty Condition	In the event that the Product fails during the Warranty Period when it is properly installed and combined with other equipment, maintained as specified in the maintenance manual, and properly operated as specified in the catalog or as otherwise agreed upon, the Seller will provide, at its sole discretion, appropriate repair or replacement of the Product free of charge, except as stipulated in the "Warranty Exclusions" as described below. However, if the Product is combined with other equipment, the Seller shall not indemnify the Buyer from any costs of removal or reinstallation of the Product from or to the appropriate equipment, or other incidental costs (such as construction cost and cost of transportation) related thereto, any lost opportunity, any profit loss or other consequential damages incurred by the Buyer.
Warranty Exclusions	<p>Notwithstanding the above warranty, the following shall be warranty exclusions:</p> <ol style="list-style-type: none">1. Any failure attributable to improper installation of the Product or improper combination with other equipment2. Any failure that may occur due to the cause that the Product is maintained in an insufficient manner and handled in an incorrect manner (for example, if it is not stored as specified in the storage procedure manual established by the Seller)3. Any failure attributable to any operation not conforming to the specification, or any other operation conditions or state unknowable to the Seller, or any failure attributable to use of a lubricant other than the Seller-recommended ones4. Any failure attributable to a problem or special specification of the equipment with which the Buyer combined the Product5. Any failure attributable to a modification or restructuring made, by the Buyer, to the Product6. Any failure attributable to a problem of a component or part supplied from or designated by the Buyer7. Any failure attributable to an earthquake, fire, flood, salt damage, gaseous damage, lightning strike, or any other reasons beyond the control of the Seller8. Warranty concerning a naturally worn and torn, abraded, or degraded consumable part (such as a bearing or oil seal) that may result after normal use of the Product9. Any failure that is caused for any of the other reasons not attributable to the responsibilities of the Seller
